mood² (mōd), *n.* [A later form of *mōde*¹, which is preferable in both the grammatical and logical uses, though not usual in the latter: see *mōde*¹.] 1. In *gram.*, same as *mōde*¹, 3.

The mood is an affection of the verb serving the variety of utterance. *A. Hume*, *Orthographie* (E. E. T. S.), p. 30.

2. In *logic*, a variety of syllogism depending on the quantity (universal or particular) and quality (affirmative or negative) of the propositions composing it. In the traditional logic the names of the moods (invented by Petrus Hispanus) are—First figure, *Bārbara*, *Cēlarent*, *Dārri*, *Fērriō*, *Bārālipton*, *Cēlantēs*, *Dābitis*, *Fāpesnō*, *Frisēsōmōrum*; Second figure, *Cēsārē*, *Cāmesrēs*, *Festinō*, *Bārōcō*; Third figure, *Dārāpti*, *Fēlapōton*, *Disāmīs*, *Dātīsī*, *Bōcārō*, *Fērison*. These names are merely mnemonic, and many of their letters are significant. The vowel *a* denotes a universal affirmative proposition, *e* the universal negative, *i* the particular affirmative, and *o* the particular negative. By the first syllable is indicated the major premise, by the second the minor, and by the third the conclusion. For example, the name *Barbara* shows that the first mood of the first figure consists of two universal affirmative premises leading to a universal affirmative conclusion. The same understanding is to be had in regard to the vowels of the other words. Certain of the consonants also are significant. Thus, all indirect moods designated by a word beginning with *b* should be reduced to *Barbara*, the first mood of the first figure; all that are designated by a word beginning with *c*, to the second mood, *Celarent*: all in *d* to *Darri*, the third; and all in *f* to *Ferrio*, the fourth. Other letters indicate how to reduce indirect to direct moods: thus *s* signifies that the proposition denoted by the vowel immediately preceding is to be simply converted in the reduction; *p*, that the proposition denoted by the vowel immediately preceding should be converted per accidens; *m*, that the premises should be transposed—that is, the major should be made the minor, and conversely; and *e*, that the mood designated by the word in which it occurs should be reduced per impossibile: whence the verbaes:

Simpliciter vult *s* verti, *p* vero per acci;
M vult transponi, *c* per impossibile duci.
Servat majorem, variatque secunda minorem;
Tertia majorem variat, servatque minorem.

A mood is a lawful placing of propositions in their dewe quality or quantitie. *Sir T. Wilson*, *Art of Logic*, fol. 26.

3. In *music*, same as *mōde*¹, 7.

Turk. *māh*), moon, month. The relations of these forms to each other, and to the words for 'month' (see *month*), and their ult. root, are undetermined. The usual explanation is that the moon is the 'measurer' (se. of time), < \sqrt{ma} , Skt. *mā*, measure (whence ult. E. *mete*¹ and *measure*). The L. name of the moon (*luna*) and the L., Gr., and Teut. names for the sun (L. *sōl* = AS. *sōl*, etc.; Gr. *ήλιος*; AS. *sunne*, E. *sun*, etc.) come from other roots, meaning 'shine.'] 1. A heavenly body which revolves around the earth monthly, accompanying the earth as a satellite in its annual revolution, and shining by the sun's reflected light. Next to the sun, the moon is the most conspicuous and interesting of celestial objects. The rapidity of its motion, the variety of its phases, and especially the striking phenomena of eclipses, compelled the attention of the earliest observers; and the fact that lunar observations can be made available to determine the longitude has given the theory of the moon's motion the first rank in economic importance, while the mathematical problems involved have proved most interesting and fertile from the scientific point of view. Of all the heavenly bodies (meteors excepted) the moon is nearest to us. Its mean distance is a little more than sixty times the radius of the earth, or 233,500 miles. The dimensions of the moon as compared with those of the earth are far greater than those of any other satellite in proportion to its primary. Its

diameter is 2,162 miles (about 0.273 of the earth's equatorial diameter), and its volume, or bulk, is 0.0204, or about one forty-ninth of that of the earth. Its mean density, however (about 3.4 times that of water), is only about three fifths of that of the earth, and its mass about one eightieth. The inclination of its orbit to the ecliptic is 5° 5' 40". It completes its revolution around the earth in an average period of 27 d. 7 h. 43 m. 11.5 s., which constitutes the *sidereal* month; the ordinary, or *synodical*, month, from new moon to new moon again, is a little more than two days longer—29 d. 12 h. 44 m. 2.7 s. (See *month*.) The moon's orbital motion is subject to considerable inequalities, due to the disturbing action of the sun, and the investigation of these inequalities makes up the major part of the "lunar theory." The moon revolves on its axis once in a sidereal month, thus always presenting nearly the same face to the earth—a circumstance which has led to the fallacy of a denial of its rotation. (See *rotation*.) Its disk appears to the naked eye diversified by dark and bright patches, giving rise to the "man in the moon" of popular fancy (see under *man*); but on examination with a powerful telescope these are lost sight of, and replaced by a crowd of interesting objects, such as mountains and valleys, craters and clefts, on a scale unknown upon the earth; the surface structure seems to be mainly volcanic, resembling very closely in certain respects, and differing most markedly in others from, that which is characteristic of volcanic regions on the earth's surface. The moon has no clouds, shows no indications of an atmosphere or of the presence of water, and is believed to have a temperature which at its maximum does not rise above the melting-point of ice. See *libration*.

In this sense obsolete, except as used, chiefly in the archaic (Middle English) form *mote*, in certain historical terms, as *folk-moot* or *folkmote*, *hallmote*, etc. See *def. 3.*

2. The place of such a meeting.—3. In *early Eng. hist.*, a court formed by assembling the men of the village or tun, the hundred, or the kingdom, or their representatives. It exercised political and administrative functions with some judicial powers. Compare *witena-gemot*. See the quotation.

The four or ten villagers who followed the reeve of each township to the general muster of the hundred were held to represent the whole body of the township from whence they came. Their voice was its voice, their doing its doing, their pledge its pledge. The hundred-moot, a moot which was made by this gathering of the representatives of the townships that lay within its bounds, thus became at once a court of appeal from the *moots* of each separate village as well as of arbitration in dispute between township and township. The judgment of graver crimes, and of life or death, fell to its share; while it necessarily possessed the same right of law-making for the hundred that the village-moot possessed for each separate village. And as hundred-moot stood above town-moot, so above the hundred-moot stood the Folk-moot, the general muster of the people in arms, at once war-host and highest law-court, and general Parliament of the tribe. But whether in Folk-moot or hundred-moot, the principle of representation was preserved. In both the constitutional forms, the forms of deliberation and decision, were the same. In each the priests proclaimed silence, the ealdormen of higher blood spoke, groups of freemen from each township stood round, shaking their spears in assent, clashing shields in applause, settling matters in the end by loud shouts of "Aye" or "Nay."

Mormon² (mōr'mōn), *n.* [Prop. attrib. use (the *Mormon Church*, *Bible*, etc.) of *Mormon*, one of the characters of the "Book of Mormon," from whom it derives that name.] An adherent of a religious body in the United States, which calls itself "The Church of Jesus Christ of Latter-day Saints." This denomination was founded in 1830 by Joseph Smith, a native of Sharon, Vermont. The government of the church is a hierarchy consisting of two orders of priesthood, an order of Melchizedek (the higher) and an Aaronic or lesser order. The former is presided

over by a president and two counselors whose authority extends over the entire church, and it includes the twelve apostles, the seventies, the patriarch, the high priests, and the elders. The twelve apostles constitute a traveling high council, which ordains other officers and is entrusted with general ecclesiastical authority; the seventies are the missionaries and the propagandists of the body; the patriarch pronounces the blessing of the church; the high priests officiate in the offices of the church; in the absence of any higher authorities; and the elders conduct meetings and superintend the priests. The Aaronic priesthood includes the bishops, the priests, the teachers, and the deacons; the two last named are the subordinate orders in the church. The duties of the bishops are largely secular. The entire territory governed by the church is divided and subdivided into districts, for the more efficient collection of tithes and the administration of the government. The Mormons accept the Bible, the Book of Mormon, and the Book of Doctrine and Covenants as authoritative, and regard the head of their church as invested with divine authority, receiving his revelations as the word of the Lord. They maintain the doctrines of repentance and faith, a literal resurrection of the dead, the second coming of Christ and his reign upon earth (having the seat of his power in their territory), baptism by immersion, baptism for the dead, and polygamy as a sacred duty for all those who are capable of entering into such marriage. The Mormons settled first at Kirtland, Ohio, then in Missouri, and after their expulsion from these places in Nauvoo, Illinois, in 1847-8 they removed to Utah, and have since spread into Idaho, Arizona, Wyoming, etc. They have frequently defied the United States government. There is also a comparatively small branch of the Mormon Church, entitled "The Reorganized Church of Jesus Christ of Latter-day Saints," which is opposed to polygamy and is ecclesiastically independent of the original organization. Also *Mormonist*, *Mormonite*.—**Book of Mormon**, one of the authoritative writings of the Mormon Church. According to the Mormons, it is the record of certain ancient peoples in America, abridged by the prophet Mormon, written on golden plates, and discovered by Joseph Smith at Cumorah (western New York), and translated by him. By anti-Mormons it is generally regarded as taken from a romance written about 1811 by Solomon Spaulding, whose manuscript was used by Smith and Rigdon.

(a) By Bonaparte and most others it is restricted to those species which have well-developed dorsal and anal fins more or less nearly opposite each other but of varying extent, and a well-developed caudal peduncle from the dorsal and anal. It includes all but one of the scyphophorous fishes. (b) By Günther it is extended to include the foregoing, together with species without an anal or caudal fin placed by other authors in the family *Gymnarchidae*. All have the body and tail scaly, head scaleless, margin of the upper jaw formed in the middle by the intermaxillaries, which coalesce into a single bone, and laterally by the maxillaries. The interoperculum is sometimes rudimentary, and on each side of the single parietal bone is a cavity leading into the interior of the skull. The family contains a number of fresh-water African fishes, representing several genera, some of which are remarkable for the prolongation of the snout. There is also great diversity in the development of the dorsal and anal fins, in some cases these being much lengthened and in others very short. *Mormyrus oxyrhynchus* is common in the Nile. Also *Mormyri*.

The same word, in the ME. form *morwen*, *mürzen*, lost the final *-n* (which was understood as a suffix) and became, through *morge*, *morve*, the source of *E. morrow*; while a deriv. form *morning* has taken the place of both forms in familiar use; see *morrow*, *morning*.] 1. Law of mortality, the principle, deduced from a study and analysis of the bills of mortality and the experiences of insurance companies during a long number of years, which determines what average proportion of the persons who enter upon a particular period of life will die during that period, and consequently the proportion of those who will survive. Tables showing the estimated number of persons of a given age that will die in each succeeding year are called *tables of mortality*. Thus, of 100,000 persons of the age of 10, 490 will not reach the age of 11; of 99,510 persons remaining alive, 397 will die before reaching the age of 12, and so on. On these tables are largely founded the calculations of insurance actuaries in regard to rates of premium, present value of policies, etc.

*morter, MHG. mortere, mortar, mortel, G. mörstel, < L. mortarium, mortar, a mixture of lime and sand, so called from the vessel in which it was made, a mortar: see mortar*¹.] A material used (in building) for binding together stones or bricks so that the mass may form one compact whole. The use of mortar dates back to the earliest recorded history, but various materials were employed for that purpose. "Bitumen" (asphaltum and maltha), or bituminous mixtures, are known to have been used in Babylon and Nineveh. Plaster (calcined sulphate of lime) was the cement employed on the great Pyramid, and apparently by the Egyptians generally, but not to the entire exclusion of what is now ordinarily called *mortar*. The substances mentioned are frequently designated as *mortar* in non-technical works. What is now generally understood by this term among builders and architects is a mixture of lime with water and sand, in various proportions, according to the "fatness" of the lime and the desire to economize the more costly material. This kind of mortar was well known to both Greeks and Romans. Mortar made of ordinary lime "sets" (hardens) in the air (not under water) and slowly, since the absorption of carbonic acid and the consequent conversion of the hydrate of lime into the carbonate is by no means a rapid process. The hardening of the mortar depends in large part on the crystallization of the carbonate of lime around the grains of sand, by which these are made to cohere firmly; hence, a clean sand of which the grains are angular is of importance in forming a durable mortar. The kind of mortar which sets under water is sometimes called *hydraulic mortar*, but is more generally known as *hydraulic cement*, or simply *cement*. See *cement* and *cement-stone*.

(a) *At common law* (and according to the present rule in some of the United States), and in form in nearly all, if not all, the States), a conveyance of real estate or some interest therein, defeasible upon the payment of money or the performance of some other condition. (b) By the law of most of the United States, a lien or charge upon specific property, real or personal, created by what purports to be an express transfer of title, with or without possession, but accompanied by a condition that the transfer shall be void if in due time the money be paid or the thing done to secure which the transfer is given. It differs from a *pledge* in that it is not confined to personal property, and in that it is in form a transfer of title, while a pledge is of chattels and is usually a transfer of possession without the title, but with authority to sell and transfer both title and possession in case of default. (See *pledge*.) At common law a mortgage was regarded (as in form it is still almost universally expressed) as actually transferring the title. (See (a), above.) Courts of equity established the rule that a mortgagee of real property could, by payment or performance, redeem it even after default, at any time before the court had adjudged his right foreclosed or the mortgagee had caused a sale of the property to pay the debt (see *equity of redemption, under equity*); consequently mortgages ceased to be regarded in most jurisdictions as a transfer of the title, and are now generally held to create a mere lien, although the form of the instrument is unchanged. The term *mortgage* is applied indifferently (a) to the transaction, (b) to the deed by which it is effected, and (c) to the rights conferred thereby on the mortgagee.

2. A state or condition resembling that of mortgaged property.

See *chattel*.—**Equitable mortgage**, a transaction which has the intent but not the form of a mortgage, and which a court of equity will enforce to the same extent as a mortgage, as, for instance, a loan on the faith of a deposit of title-deeds.—**General mortgage-bond.** See *bond*¹.—**Mortgage debentures.** See *debenture*, 1.—**Welsh mortgage**, a kind of mortgage formerly used in Wales and Ireland, by which the mortgager, without engaging personally for the payment of the debt, transferred the title and possession of the property to the mortgagee, who was to take the rents and profits and apply them on the interest; and there might be a stipulation that any surplus should be applied on the principal. Under this form of mortgage the mortgagee could not compel the mortgager to redeem or be foreclosed of his right to redeem, for no time was fixed for payment, and the mortgager was never in default; but the mortgagee had the right at any time to redeem (and, though there were no personal debt, an account might be taken as if there were, in order to ascertain what he must pay to redeem); and the statute of limitations did not begin to run against his claim until after full payment of the principal.

The dome, supported on pendentives, and the arch, usually pointed, of the horseshoe (Saracenic) form, and springing from slender columns, together with elaborate and often splendidly colored surface-ornament, mainly geometrical, are features of very frequent occurrence. family *Culicidae* or gnats, though some members of related families, as *Simuliidae*, are called mosquitos, the term being applied in most parts of the world to gnats which have a piercing and sucking proboscis and annoy man. They breed in water, and hence are most numerous in marshy and swampy places. The life of the adult insect is very brief, and its natural food is a drop or two of the juice or moisture of plants. The name has been used with great latitude and little discrimination for many small singing birds of all parts of the world, as the true *Sylvia* or Old World warblers, various *Muscicapidae* or Old World flycatchers, many of the American *Sylviidae* or wood-warblers, and for all the *Motacillidae*, including the pipits or titlarks of the subfamily *Anthinae*. It is now restricted to the black-and-white or pied wagtails, as *M. alba*, of lithe form, with massed coloration of black, white, and ash, long vibratile tail of twelve weak narrow feathers, pointed wings whose tip is formed by the first three primaries, and whose inner secondaries are long and flowing, and long slender feet without specially lengthened or straightened hind claws. There are many species, widely distributed in Europe, Asia, and other parts of the Old World, one or two of which sometimes straggle to America. Thus, *M. alba* has been found in Greenland and *M. ocularis* in California.

Motacillidae (mò-tā-sil'i-dē), *n. pl.* [NL., < *Motacilla* + *-idae*.] A family of oscine birds of the order *Passeres*, typified by the genus *Motacilla*; the wagtails. The bill is shorter than the head, straight, slender, acute, and notched; the primaries are nine in number; the inner secondaries are lengthened; the feet are long and slender, with scutellate tarsi and usually long and straightened claw; and the tail is usually as long as the wings. The *Motacillidae* are small insectivorous birds of terrestrial habits, resembling larks (*Alaudidae*) in some respects, but widely separated by the laminiplumination of the podotheca. Two subfamilies are generally recognized, *Motacillinae* and *Anthinae*, or wagtails proper and pipits or titlarks.

It contains the wagtails proper as distinguished from the pipits or *Anthinae*, having the point of the wing formed by the first three primaries, the tail as long as the wing or longer, and the coloration either pied with black and white or varied with yellow and green. There are some 50 species, chiefly of two leading genera *Motacilla* and *Eudyles*. See *wagtail*.

Motazilite (mò-tāz'i-lit), *n.* [From an Arabic word meaning 'to separate.'] One of a numerous and powerful sect of Mohammedan heretics, who to a great extent denied predestination, holding that man's actions were entirely within the control of his own will. They held extremely heretical opinions with reference to the quality or attributes of Deity. They appeared a few generations after Mohammed, and became one of the most important and dangerous sects of heretics in Islam.

Originally the motet was designed as a contrast to the plain-song of the remainder of the service, and probably it often possessed something of the graceful intricacy of the madrigal. The earliest motets date from about 1300. The use of an instrumental accompaniment is usually limited, and often avoided altogether. 1. 13. In law: (a) An application to a court or judge, usually in the course of a legal proceeding. Whatever is asked of a court by a suitor is asked by a *motion*. (b) More narrowly, an application which is incidental to the progress of a cause, as distinguished from the trial or investigation of the issue: as, a *motion* for an injunction; a *motion* to open a default. Still further distinctions are made in common parlance. Thus, applications on the trial incidental to its progress, such as to strike out testimony or to grant a non-suit, are called *motions*, though, being on the trial, and the result being included in the judgment, they are not *motions* within the rules regulating the formalities required for making motions, the record of the decision, the award of costs, or the mode of review. (c) In some of the United States, the paper drawn up by the attorney of the moving party, saying, "now comes the plaintiff (or defendant)," etc., "and moves," etc. (much in the same way that an application to the court would be entered in the minutes), and filed with the clerk in advance of applying to the court, and usually also served on the other party.—14. In music: (a) The melodic change of a voice or voice-part from one pitch to another; melodic progression. It is *concrete*, *conjunct*, or *conjunct* when it consists of a single step, *discrete* or *disjunct* when of a skip. (b) The melodic progression of any two voice-parts in harmonic writing in relation to each other. It is *similar* when both voice-parts rise or fall at the same time, *parallel* when they together rise or fall by the same interval, *contrary* or *opposite* when one rises and the other falls, *oblique* when one rises or falls while the other remains stationary, and *mixed* when all varieties occur at once in several parts. In general, between important or conspicuous parts, contrary motion is sought. Parallel motion in perfect fifths or octaves is regularly forbidden; and similar motion to a perfect fifth or octave is employed sparingly.

15. In the *fine arts*, the change of place or position which, from the attitude represented, a figure is portrayed as making. It can only be implied from the attitude which prepares the subject for the given change, and therefore differs from *action*.

16. In *med.*, evacuation of the intestine; alvine discharge.

—**Absolute motion**, change of absolute place.—**Accelerated motion**. See *accelerate*.—**Active motion**, in *kinestherapy*, motion of the limbs or other parts of the patient produced by his own exertion, in contradistinction to *passive motion*, where the limbs are moved by the attendant.—**Angular motion**. See the adjectives.—**Lateral motion**, in a railroad-car, the end-play or freedom of movement of an axle in its boxes, or the freedom of movement between a swing-bolster and a truck.—**Laws of motion**, specifically, Newton's three laws of motion, which are as follows: *First Law*. Every body continues in its state of rest, or uniform motion in

a straight line, except so far as it may be compelled by force to change that state. *Second Law*. Change of motion is proportional to force applied, and takes place in the direction of the straight line in which the force acts. *Third Law*. To every action there is always an equal and contrary reaction; or, the mutual actions of any two bodies are always equal, and oppositely directed.—**Line of motion**. See *line²*.—**Local motion**. See *local*.—**Lost motion**, in *mech.*, any difference of motion between the driving parts of a motor and the driven machine, or between the parts of a machine that communicate motion from one to another. It results from faulty construction of the parts, or from looseness of the boxes of axles or shafting or of a belt, which is thus permitted to slip.—**Natural motion**, an involuntary movement of the body, as the beating of the heart.—**Overhead motion**, a mechanism, consisting of countershafts and speed-pulley arrangements of gears or of any other contrivances, for increasing speed or force, interposed between some prime mover or main line of power-transmission and a machine with which it communicates. It is so called because, for convenience in transmission, or that it may not occupy working-space, it is placed over the machine affected by it. Also called *overhead work*.—**Paracentric motion**, motion to or from an attracting center.—**Parallel motion**. (a) See *parallel*. (b) In *music*. See *def. 14 (b)*.—**Passive motion**. See under *active motion*.—**Perpetual motion**. (a) A machine which should do work without exhausting any power of doing work—that is, its work must not be accompanied by any displacement (such as the fall of a weight, or the uncoiling of a spring) or transformation (such as the combustion of fuel) which could not be undone by a replacement or counter-transformation without the expenditure of as much work as the machine has done. Such a machine is impossible, and contrary to all experience; for power of doing work is never increased nor diminished. Nevertheless, very many pretended perpetual motions have been put forth by deluded or knavish inventors. Most of them are of two classes—1st, those which depend upon gravity or magnetism, and, 2d, those which depend upon centrifugal force or other pressure mistaken for moving power. (b) The mode of motion of such a machine. (c) By a popular abuse of the term, a movement or machine which could go on indefinitely by its own self-generated power. Thus, if a man should pretend to have a wheel which turned upon its bearings without resistance, so that it would go on moving indefinitely, or to have a fluid which, though viscous, was frictionless, so that its motion, though continually decreasing, never came to rest, neither claim would be a claim to a perpetual motion, nor (however unfounded) would it violate any fundamental principle of mechanics. On the other hand, a machine (such as has actually been proposed) which would not go on moving of itself forever, but would require a little external force to overcome friction, but which with that little force should be capable of doing an indefinite amount of work, would, properly speaking, be a perpetual motion.—**Positive motion**, in *mech.*, an arrangement of apparatus connecting related parts of a machine in such manner that, as one moves, the other must move in accordance with the law of the relation. For example, the system of gearing which takes motion from the lathe-spindle, and imparts motion to the lead-screw of a lathe, is a positive motion. On the other hand, any mechanism which moves a part of a machine in a manner that permits the possibility of some subsequent motion, or variation of the motion, of the part, through the action of any force not directly transmitted by such mechanism, is not positive. Examples of motions not positive are—the mechanism actuating a tilt-hammer, which falls by its gravity; a spring which by its elasticity recoils; and pulleys driven by belts in which the motion may be varied through slip.—**Positive-motion loom**. See *loom¹*.—**Primary motion**, the diurnal motion of a fixed star.—**Proper motion**, in *astron.*, that apparent motion or angular velocity of a fixed star which is due to a real movement of the star itself relatively to the other stars.—**Quantity of motion**, momentum, the sum of the velocities of all the particles each multiplied by the mass.—**Rectilinear, parabolic, or circular motion**, motion in a rectilinear, parabolic, or circular path.—**Relative motion**, change of relative place.—**Retrograde motion**, in *astron.*, decrease in the longitude of a star.—**Rotational motion**. See *vortex-motion*.—**Secondary motion**, the proper motion of a fixed star.—**Simple harmonic motion**, a motion like a uniform motion round the circumference of a circle which is looked at edgewise: "When a point Q moves uniformly in a circle, the perpendicular QP drawn from its position at any instant to a fixed diameter AA' of the circle intersects the diameter at a point P, whose position changes by a *simple harmonic motion*." *Thomson and Tait*.—**Slide-valve motion**, in a steam-engine, broadly, the valve-gear; any one of a great variety of devices for imparting to a slide-valve its proper motion for induction, cut-off, exhaust, and compression or cushioning of steam at the end of the piston-stroke; specifically, the motion of a slide-valve produced by the valve-gear. The link-motion is one of the most important of valve-gears. In the majority of slide-valve motions the primary movement is derived from an eccentric keyed to the crank shaft. In other cases motion is taken from the cross-head. In the Joy valve-gear the primary movement is obtained from the connecting-rod. See *induction, cut-off, exhaust, eccentric, and valve-gear*.—**Take-up motion**, in a loom, the mechanism which takes up and winds the woven cloth on the cloth-beam as fast as the warp is unwound from the warp-beam. The name is also given to analogous mechanism in many other kinds of machines.—**Violent motion**, in older writers, a motion impressed upon a body by an external force.—**Voluntary motion**, motion ensuing on an act of will, in contrast with reflex action or motion.—**Syn. Motion, Movement, Move.** *Motion* may be considered separate from that which moves; *movement* is always connected with the person or thing moving; hence we speak of the laws of *motion*; of heat as a mode of *motion*; and of perpetual *motion*—not of *movement* in any of these cases; hence, also, *motion* is the more scientific and technical term. *Motion* is more general and more voluntary; *movement*, more particular and occasional; hence we speak of a *motion* with the hand; a *movement* of troops; involuntary *movements*; the *movements* of the heavenly bodies; the rate of *motion* or of *movement*. The figurative uses of the two correspond to the literal. The

chief uses of *move* are founded upon the idea of moving a piece, in chess or a similar game, for winning the game.

II. n. 1. A mental state or force which induces an act of volition; a determining impulse; specifically, a desire for something; a gratification contemplated as the final cause of a certain action of the one desiring it. The term *motive* is also loosely applied to the object desired. The noun *motive*, in this sense, was brought into general use by writers influenced by Hobbes (though he uses the adjective only), who held that men's actions are always governed by the strongest motive, and denied the freedom of the will. It is now, however, in common literary and conversational use, apart from any theory.

What moves the mind, in every particular instance, to determine its general power of directing to this or that particular motion or rest? And to this I answer, the *motives*. For continuing in the same state or action is only the present satisfaction in it; the *motive* to change is always some uneasiness.

Locke, Human Understanding, II. xxi. § 29.

Without another life, all other *motives* to perfection will be insufficient.
Ep. Atterbury, sermons, l. xi., Pref.

By *motive*, I mean the whole of that which moves, excites, or invites the mind to volition, whether that be one thing singly, or many things conjunctly.

Edwards, On the Freedom of the Will, i. 2.

When the effect or tendency of a *motive* is to determine a man to forbear to act, it may seem improper to make use of the term *motive*; since *motive*, properly speaking, means that which disposes an object to move. We must, however, use that improper term, or a term which, though proper enough, is scarce in use, the word determinative.

Beutham, Intro. to Morals and Legislation, x. 3, note.

2. The design or object one has in any action; intention; purpose; the ideal object of desire.

J. A. Symonds, Italy and Greece, p. 218.

6f. Motion; proposition.

Suche *motives* then moue this maistres In her glorie, And maken men in mysbileno that muse moche on her wordes.

Piers Plowman (B), x. 113.

Leading motive. See *leading*. = *Syn. 1. Motive, Reason, Inducement, Incentive, Impulse*, consideration, prompting, stimulus. The differences among the first five of these words are suggested by the derivations. A *motive* is that which moves one to act, addressing the will, as though directly, and determining the choice; it is the common philosophical term, and may be collective: as, the whole field of *motive*. A *reason* is that which addresses the rational nature by way of argument for either belief or choice. An *inducement* leads one on by his desire for good: as, to hold out an additional *inducement*. An *incentive* urges one on like martial music. An *impulse* drives one on, but is transitory.

motive (mō'tiv), *v. t.*; prot. and pp. *motived*, ppr. *motiving*. [*< motive, n.*] To act on as a motive, or with the force of a motive; prompt; instigate. [Recent.]

motiveless (mō'tiv-less), *a.* [*< motive + -less.*] Having no motive or aim; objectless.

Though inconceivable, a *motiveless* volition would, if conceived possible, be conceived as morally worthless.

Sir W. Hamilton.

motmot (mot'mot), *n.* [Also *momot*; said to be so named from the bird's note, which sounds like *mot-mot*, slowly repeated.] A bird of the family *Momotidae* or *Prionitidae*; a sawbill. These birds are peculiar to America, inhabiting tropical and subtropical forests, and ranging north nearly or quite to Texas. The average size is about that of the jays, to which they have some superficial resemblance; but they are more like the bee-eaters of the Old World, *Mercopidae*, having a similar slender form, with long tail, of which the middle feathers project beyond the rest and are spatulate, forming a kind of racket. The bill is serrate, the coloration is variegated, chiefly greenish and bluish. These birds are of solitary habits, like kingfishers, to which they are closely related; they feed upon reptiles, insects, and fruits. See *cut under Motmot*.

moto (mō'tō), *n.* [It., = Pg. *moto*, *< L. motus*, motion; see *moté*.] In music: (a) Motion; the direction in which the harmonic parts move: as, *moto contrario* (contrary motion). See *motion*, 14. (b) Energetic or spirited movement; spirit: as, *eon moto* (with spirited movement).

motograph (mō'tō-gráf), *n.* [*< L. motus*, motion, *+ Gr. γράφειν*, write.] A form of telegraph or telephone-receiver, invented by Edison, depending for its action on the variation of the friction between two conductors in relative motion, when a current of electricity is passed from one to the other across the surface of contact. A revolving drum is interposed in the circuit, one of the electrical connections being made through a movable terminal in contact with the surface of the drum. This contact-piece is connected to a recording lever or to a telephonic diaphragm, and, in consequence of the variations of the friction produced by the electric currents, causes the lever to record, or the diaphragm to repeat, the message.

I. n. 1. One who or that which imparts motion; a source or originator of mechanical power; a moving power, as water, steam, etc.

These bodies likewise, being of a congenious nature, do readily receive the impressions of their *motor*.

Sir T. Browne, Vulg. Err., ii. 2.

Specifically—2. In *math.*, an operator or a quantity which represents the displacement of a rigid body. It involves the designation of a particular line in space, and the association with it of a length and an angle.

This is in complete analogy with his [Clifford's] introduction of the word *motor* to embrace the species twist and wrench.

The Academy, June 29, 1889, p. 452.

3. In *mach.*, a prime mover; a contrivance for developing and applying mechanically some natural force, as heat, pressure, weight, the tide, or the wind; a machine which transforms the energy of water, steam, or electricity into mechanical energy: as, an electric *motor*. See *machine*, 2.—4. A motor-car.—5. In *anat.*, specifically, a motor nerve.—**Air-motor.** (a) A machine driven by compressed air. Such machines are constructed like steam-engines, and use the air expansively or non-expansively, according to the character of the engine. They are, strictly speaking, heat-engines, in which the heat naturally existing in air, or this in connection with heat derived from the work of compression, is converted into *outer work*. When the air is used expansively, the expansion is regulated by *cut-off valve-gear*, as in a steam-engine. Expansion is, however, not generally so available as with steam, on account of the chilling of the air during the period of expansion and consequent freezing of precipitated aqueous vapor, which clogs the valve-ports with ice, and seriously interferes with the working of such engines. This difficulty is avoided by heating the air prior to its induction to the cylinder of the engine, but, except in the so-called *caloric engine*, this principle has not been widely adopted. See *caloric engine* (under *caloric*), *ice-machine*, and *cut under air-engine*. (b) A motor-car driven by an air-motor.—**Domestic motor**, a small motor used for pumping water, or running a sewing-machine, etc.—**Electric motor.** See *electric*.—**First motor**, a prime motor.—**Hydraulic motor.** See *hydraulic*.—**Motor oculi**, the third pair of cranial nerves, giving motor impulse to most of the muscles of the eye. Also called *oculomotor*. See *second cut under brain*.

II. a. 1. Giving motion; imparting motion.

Asceticism throws away a great power given by God to help and improve us. It abandons to evil what might be a vast *motor* force leading to good.

J. F. Clarke, Self-Culture, p. 392.

2. In *physiol.*, conveying from the center toward the periphery an impulse that results or tends to result in motion, as a nerve: opposed to *sensory*.—3. Of or pertaining to or acting through the motor nerves or tracts.

A vigorous *motor* system, ready to act, and to act energetically, is a condition of a rapid development of will.

J. Sully, Outlines of Psychol., p. 598.

Many cases of *motor* disturbance occur without the disturbance of sensation in the same extremity.

G. T. Ladd, Physiol. Psychology, p. 284.

Motor dynamo, a dynamo used as a motor. When one dynamo is being driven by another the driver is sometimes called the *motor dynamo*.—**Motor nerve**, any nerve whose function is to excite muscular contraction, and thus effect movement in an animal body. Most nerves are of mixed character, or sensorimotor, effecting both motion and sensation. See *vasomotor*.—**Motor printer**, a printing telegraph in which the mechanism is moved by electric, steam, or other motive power.

6. In *civil engin.*, in excavations, a piece of the original ground left at intervals to show the depth.—**Indian mounds**, earthworks erected by the aborigines of North America, the so-called mound-builders. They are especially numerous in that part of the United States which lies between the Great Lakes on the north and the Gulf of Mexico on the south, and is bounded on the west by the States lining the western bank of the Mississippi river, and on the east by a line drawn through the middle of the States of New York and Pennsylvania and extending southward so as to include the greater part of the two Carolinas and the whole of Georgia and Florida. Some of these works are very extensive and of varied character, consisting of mounds or tumuli, either conical or truncated, together with embankments or walls of earth or stone, which inclose areas of great size, and not infrequently are accompanied by wide and deep ditches. Thus the work at Newark, Ohio, covers an area of two square miles and consists of a network of hillocks and lines of circumvallation. So far as is known, some of these works were used as burial-places, and as the sites of rude dwellings and cabins; others were intended, no doubt, for purposes of defense, and others, again, may have been connected in some way with religious rites and ceremonies. Many of them were situated in the river-valleys; and not a few of the most prosperous cities in the Mississippi valley occupy sites once taken up by them.

I venture the assertion that not only has there not, as yet, been anything taken from the mounds indicating a higher stage of development than the red Indian is known to have reached, but that even the mounds themselves,

and under this head are included all the earthworks of the Mississippi Valley, were quite within the limits of his efforts. *L. Carr, Mounds of the Mississippi Valley, p. 3.*

mound¹ (mound), *v. t.* [*< mound¹, n.*] To fortify with a mound; add a barrier, rampart, etc., to.

See *cut under Megapodius*.

mound-builder (mound'bil'der), *n.* 1. One of a race of people by whom the various earthworks called *Indian mounds* (see *mound¹*) were constructed. That these works are not necessarily of great antiquity, and that they were built by a race in no essential respect different from that found inhabiting the region where they occur when this was first settled by the whites, is the present opinion of nearly all the best-informed investigators of American archaeology. See quotation under *Indian mounds*, above.

In districts where the native tribes known in modern times do not rank high even as savages, there formerly dwelt a race whom ethnologists call the *Mound-Builders*, from the amazing extent of their mounds and enclosures, of which there is a single group occupying an area of four square miles. *E. B. Tylor, Prim. Culture, i. 50.*

Mountain is related to mount¹ as fountain is to fount¹.] **I. n.** 1. An elevation of land of considerable dimensions rising more or less abruptly above the surrounding or adjacent region. Ordinarily no elevation is called a mountain which does not form a conspicuous figure in the landscape; hence, what is a mountain in one region might be regarded as simply a hill in another. A region may have great elevation above the sea-level, but not be recognized as a mountain. Thus, the Plains, or the region between the Missouri and the Rocky Mountains, have an elevation on their western edge as great as that of the highest points of the Appalachian range. Elevated regions not mountains are often called *plateaus*. Elevations, although of considerable height, if quite isolated or precipitous, are often called *rocks*: as, the *Rock of Gibraltar*. *Peak* is occasionally used in the same way: as, *Pike's Peak*; the *Peak of Tenerife*; and in the United States, in regions formerly occupied or explored by the French, the word *butte* is employed with a somewhat similar meaning, while *mount* is used over a considerable extent of country, especially in Wisconsin, as nearly the equivalent of *butte* or *mount*. For ranges or connected series of mountains, see *mountain-chain*.*

The wood is used for tools; the berries afford malic acid, and all parts of the tree, as also of the American species, are astringent. The best-known American mountain-ash is *P. americana*, a similar tree, but with larger leaves, and smaller though deeper-colored fruit. mountain-chain (moun'tān-chān), *n.* A connected series of mountains or conspicuous elevations. In the formation of mountains other than volcanic the process has usually been of such a character that a long strip of country has been raised in a sort of crest or wall; indeed, regions thousands of miles in length have occasionally been thus affected. This elevated ridge or wall has either in the original process of mountain-building been raised into masses or subdivisions of varying height and more or less isolated from each other, or else long-continued erosion and exposure to atmospheric agencies have brought about the same result. The more or less separated and distinct peaks, summits, or crests together make up the range. It is impossible to establish any criterion by which one mountain-range can be separated from another adjacent one. In most cases, however, there is more or less similarity, if not absolute identity, between the different parts of a range, from both a geological and a topographical point of view; but there are ranges which are made up of parts differing from each other greatly in lithological character and in the epoch of their formation, and which, nevertheless, are always popularly considered as forming one system, and are so designated: this is the case with most of the greater mountain-chains, as the Himalayas, the Andes, and the Cordilleras.

The oral opening or ingestive aperture of an animal, of whatever character and wherever situated; the os, or oral end of the alimentary canal or digestive system. The mouth is in the head in most animals, and serves for taking in food, mastication, deglutition, and the utterance of the voice. In nearly all vertebrates the mouth is com-

posed of upper and under jaws and associate parts, and consequently opens and shuts vertically; in many the orifice is closed by fleshy movable lips, and the cavity is furnished with teeth and a tongue. Appropriate salivary and mucous glands moisten the interior, which is lined with epithelium. In most invertebrates, as the enormous assemblage of arthropods, the basis of the mouth is clearly seen to be modified limbs, and the jaws work sidewise. In other cases the mouth, though definite in position and character in each case, varies too widely to be defined excepting as the ingestive orifice. In protozoans any part of the body may act as a temporary mouth; and in many worms there is never any mouth or special digestive system, food being absorbed directly through the integument. The most complicated mouths are found among insects and crustaceans (see cut under *mouth-part*). See the qualifying words. — **Geneva movement**, in clockwork, calculating-machinery, and recording-mechanism, a peculiar system of wheel-work, consisting of a notched wheel and a single-toothed wheel (which may be smaller than the notched wheel), the spaces between the notches on the wheel B being made concave on the perimeter, and the concave parts being arcs of circles having the same radius as the toothless part of the perimeter of the wheel A. The wheels are so centered in relation with each other that, in rotating, the tooth of the wheel A engages a notch in the wheel B, moving the latter radially, and after the tooth releases itself from the notch the perimeter of the wheel A engages with the adjacent concave in the wheel B and locks the latter, restraining it from moving till the wheel A has again brought its single tooth around into engagement with the next notch in the wheel B. The latter is thus moved once and locked at each turn of the wheel A. If the wheel B has ten notches, it will turn once, and can thus be made to carry or record one for every ten turns of the wheel A, and in this form it is much used in various measuring, counting, and adding-machines and recording-instruments. Where a stop-movement of the wheel B is desired, the notches are spaced according to the movement required, and the wheels have equal diameters.

The Geneva Stop Movement, used in Swiss watches, to limit the number of revolutions in winding up, the convexly curved part, a, of the wheel B serving as the stop.

mowing-machine (mō'ing-mā-shĕn'), *n.* A machine for mowing grass. The terms *mowing-machine, harvester, and reaper* are in a measure interchangeable. While essentially the same machine, the mowing-machine or mower is used for cutting grass and clover, and the reaper for cutting grain. Both mowers and reapers, more properly the latter, are harvesters. The mowing-machine is essentially a vehicle fitted with some form of gearing for transmitting the motion of the axle to a set of reciprocating knives. An arm projects from the vehicle and carries a series of points or finger-like guards, in and between which play a series of lance-shaped knives. This bar is made to travel close to the ground while the shearing action of the row of reciprocating knives between the guards mows down the grass. A track-clearer or wing at the end of the bar guides the cut grass toward the machine, so that a clear track will be formed for the tread-wheel at the next passage of the mower in the field. Mowers have one driving-wheel or two, and either a fixed and rigid cutter-bar or, more often, a bar hinged so that it can be turned up out of the way when not in use for mowing.

In its present form, which shows some assimilation to the Roman mass, this liturgy was restored and revised by Cardinal Ximenes in A. D. 1500, and is still in use in the chapel of a college at Toledo founded by him, and in a few other chapels or churches. The Roman liturgy was made compulsory in Spain, with the exception of a few churches, about A. D. 1100, and in the thirteenth and succeeding centuries the national liturgy had fallen into almost entire disuse. The inappropriate epithet *Mozarabic*—that is, 'Arabizing'—may have been given to this liturgy from its longer retention in that part of Spain which was held by the Moors, or may have been meant as an unfavorable reflection upon it by the friends of the Roman rite. Apart from obvious Roman insertions, this liturgy is found to agree with canons of early Spanish councils, especially that of Toledo in A. D. 633, and with an account of the Spanish liturgy given by St. Isidore of Seville at about the same date. The Mozarabic liturgy closely resembles the Gallican liturgies, belongs with them to the Ephesine, Gallican, or Hispano-Gallican group of liturgies, and, as the only full and complete extant member of that group, serves as its type and representative. Among the marked peculiarities of this liturgy are (1) the nature, arrangement, and unequalled variability of its parts; (2) its Oriental affinities, such as remains of the epiclesis, proclamations by the deacon, the position of the pax, the presence of the Sancta Sanctis, etc.; (3) the elaborate ritual of the fraction; and (4) the use of a peculiar nomenclature for the parts, considerably different even from that of the Gallican uses, as, for instance, *officium for introit*, *sacramentum for offertory anthem*, *illation for preface*, etc. See *Ephesian, Gallican, Liturgy*.—**Mozarabic office**, the office for the canonical hours according to the ancient Spanish rite, as given in the breviary published by Ximenes in A. D. 1502.—**Mozarabic rite**, the Mozarabic office and liturgy.

MHG. *tier*, G. *thier*, Dan. *dyr*, beast, = F. *decr*); < L. *mulus*, a mule. The E. *mule* does not come from the AS. *mül*, which would give a mod. form **mowl* (cf. *oel*, < AS. *ülc*); it depends on the OF. or

the orig. L.] 1. A hybrid animal generated between the ass and the horse. The cross is usually between a jackass and a mare, that between a stallion and a she-ass being called a *hinny*. The mule is a valuable product of artificial selection, in some respects superior to either parent, and is extensively bred in America (Kentucky, Missouri, Mexico, etc.), in Spain, in Poitou (France), etc. It retains to some extent the specific characters of the ass, in the comparatively large head, long ears, roached mane, slim tail, and narrow, pointed hoofs, but acquires much of the size, strength, and symmetry of the mare. The animal matures slowly, is very long-lived, little liable to disease, and able to do more work than a horse under hard treatment and poor fare. Being also very agile and sure-footed, it is serviceable as a pack-animal in countries where a horse could scarcely be used. The mule is not less docile and intelligent than the horse, and its strength is, in proportion to its size, probably greater. Mules are ordinarily incapable of procreation, and such seems to be always the case with the jack; but instances of impregnation of the hinny by the male ass or by a stallion are not rare.

They drewe owt of dronmardaries dyverse lordes,
Moyllez mylke whitte, and mervayllous bestez,

5. In *spinning*, a machine invented by Samuel Crompton (completed 1779), in which the rovings are delivered from a series of sets of drawing-rollers to spindles placed on a carriage which travels away from the rollers while the thread is being twisted, and returns toward the rollers while the thread is being wound: so named because it was a combination of the drawing-rollers of Arkwright and the jenny of Hargreaves.—6. In *numis.*, a coin, token, or medal which, owing to mistake or caprice, consists of two obverse or two reverse types, or of which the obverse and reverse types are accidentally associated. Thus, a denarius having a head of Tiberius on each side, or a denarius having the head of Tiberius on the obverse and a reverse type struck from one of the coin-dies of Augustus, would be a *mule*.

The encouragement given to the creation of new varieties [of English tradesmen's tokens in the eighteenth century] by combining obverse and reverse dies that had no real connection was satirized by a token bearing the reverse type of an ass [that is, a token-collector] and mule saluting each other, [and] having for the legend "Be assured, friend mule, you shall never want my protection." The very appropriate term *mule* was ever after applied to these illegitimate varieties.

It may be doubted whether any of us have ever yet realized the enormous change which has taken place in the conditions of national progress by the *multiplication* and diffusion of cheap books. *Nineteenth Century*, XXIV. 499.

2. An arithmetical process in which one number, the *multiplier*, is considered as an operator upon another, the *multiplicand*, the result, called the *product*, being the total number of units in as many groups as there are units in the multiplier, each group being equal in number to the multiplicand; more generally, the operation of finding the quantity which results from substituting the multiplicand in place of unity in the multiplier. Thus, the multiplication of 4 by 5 gives 5 times 4, or the number of units in five groups of four units each; so the multiplication of $\frac{2}{3}$ by 3 consists in finding $\frac{2}{3}$ not of unity, but of $\frac{2}{3}$ of unity. By further generalization, multiplication in the higher mathematics is regarded as the process of bringing an operand under an operator. Thus, in quaternions, if u be the operation of turning a line in a given direction through a given angle, and if v be another similar versor, then uv , or the result of the multiplication of v by u , is the rotation which would result from turning a line first through v and then through u . In like manner, in the theory of differential equations, if D_x denote the operation of differentiation relatively to the variable x , and D_y denote the same operation relatively to the variable y , then the operation of differentiating first relatively to y and then relatively to x is regarded as the product of D_y by D_x , and is written $D_x D_y$. In the algebra of logical relations, the multiplication of one relative by another consists in putting the relates of the multiplicand disjunctively in place of the correlates of the multiplier. In other cases, multiplication consists in conjoining (in some specific way) each unit of the multiplier with each unit of the multiplicand; and this definition may be regarded as including every other. Thus, the multiplication of 2 feet of length by 3 feet of breadth is considered as giving 6 feet of area, in each of which square feet one unit of length is conjoined with one unit of breadth. So the momentum of a body having a motion of translation is said to be the product of the mass into the velocity—that is, is the result of imparting to each particle of the mass the whole of the given velocity. In the Boolean algebra, the product of two classes A and B is the whole of the class embraced by both—that is, it embraces all the individuals each of which reunites the characters of A and of B. In algebra, multiplication is denoted by writing the multiplier before the multiplicand, either directly, or with a cross (×) or a dot (·) interposed between them. All multiplication follows the distributive principle, expressed by the formula

$$(a + b)(c + d) = ac + bc + ad + bd.$$

Under certain restrictions, all multiplication follows the associative principle, expressed by the formula $a(bc) = (ab)c$. According to the nature of the conjunction of units, multiplication does or does not follow the commutative principle, expressed by the formula $ab = ba$.

Aquinas and others distinguish *transcendental* and *material* *multitude*; but it is difficult to attach any definite conception to transcendental multitude, which is the opposite of transcendental unity. Material multitude is the multitude of individuals of the same species, an expression which supposes matter to be the principle of individuation.

A very subtle argument could not have been communicated to the *multitudes* that visited the shows.

mummy¹ (mum'i), *n.*; pl. *mummies* (-iz). [Formerly also *mummie*, *mummee*; in late ME. *mommy*, *momyan* (def. 2); = D. G. Sw. Dan. *mumie*, < OF. *mumie*, F. *momie* = Sp. Pg. *momia* = It. *mummita*, < ML. *mumia*, *momia*, *mummiu* = NGr. *μῦμια* = Turk. *mumiyä* = Pers. *mūmiyā* (> Hind. *mumiyā*), a mummy (Hind. also a medicine), < Ar. *mūmiyā*, pl. *mūmīmi*, an embalmed body, a mummy, < *mūm* (> Pers. *mūm*, > Hind. *mom*), wax (used in embalming); cf. Coptic *mun*, bitumen, gum-resin.] 1. A dead human body embalmed and dried after the manner of the ancient Egyptian preparation for burial. An immense number of mummies are found in Egypt, consisting not only of human bodies, but of those of various ani-

mals, as bulls, apes, ibises, crocodiles, fish, etc. The processes of embalming bodies were very various. The bodies of the poorer classes were merely dried with salt or natron, and wrapped up in coarse cloths. Those of the rich and the great underwent the most complicated operations, and were laboriously adorned with various ornaments. The embalmers extracted the brain through the nostrils, and the entrails through an incision in the side. The body was then shaved and washed, the belly filled with perfumes, and the whole body covered with natron, and steeped in the same material for seventy days. After this the corpse was washed, treated with balsam or other antiseptics, and then wrapped up in linen bandages, sometimes to the number of twenty thicknesses. The body was then put into an ornamented case of wood or cartonnage. Sometimes the cases were double. The term *mummy* is likewise used of human bodies preserved in other ways, either by artificial preparation or by accident. The Guanches, or ancient people of the Canaries, embalmed their dead in a simple but effectual manner. In some situations the conditions of the soil and atmosphere, by the rapidity with which they permit the drying of the animal tissues, are alone sufficient for the preservation of the body with the general characteristics of a mummy. This is the case in some parts of South America, especially at Arica (formerly in Peru), where considerable numbers of bodies have been found quite dry, in pits dug in a dry saline soil. In some places natural mummies are occasionally found in caverns or in crypts, as in a well-known church-crypt in Bordeaux, France. Natural mummies of various animals are often found in such state of preservation as to allow of scientific description of many of their parts.

Sir M. Hale, Hist. Com. Law of Eng.

I call it *municipal law*, in compliance with common speech; for, though strictly that expression denotes the particular customs of one single municipium or free town, yet it may with sufficient propriety be applied to any one state or nation which is governed by the same laws and customs.

Blackstone, Com., Int., § 2.

The term *municipal* [for local or provincial law] seemed to answer the purpose very well till it was taken by an English author of the first eminence to signify internal law in general, in contradistinction to international law, and the imaginary law of nature. It might still be used in this sense, without scruple, in any other language.

murex (mū' rēks), *n.* [*NL., < L. murex, the purple-fish.) 1. [cap.] The typical genus of Muricidae. The aperture of the shell is rounded, the canal is long and straight, and the outer surface of the shell is interrupted by numerous varices or spines, at least three to a whorl. The most remarkable forms of these shells are from tropical seas. The animals are highly rapacious, and some of them do great damage to oyster-beds, as the European M. erinaceus. The celebrated purple dye of the ancients was chiefly furnished by the animals of two species of the genus Murex, M. trunculus and M. brandaris, the dye being secreted by a special gland, called the "purpurigenous gland," of the animal. The amount secreted being very small, the number of animals sacrificed to secure it was correspondingly large, and the cost therefore great. Hence its use was confined to the wealthy, or reserved for sacred or regal purposes. Its manufacture seems to have expired after the capture of Constantinople by the Turks.*

This material and the various things made from it are mentioned by several Greek and Latin authors, but Pliny is the only one who has attempted any detailed description of it. Unfortunately his accounts are so vague that the material cannot be positively identified, nor has anything been found in the excavations at Rome which is certainly known to be the ancient murra. In the opinion of the best authorities, however, it was fluor-spar, for of the known materials this is the only one found in abundance which has the peculiar coloration indicated by Pliny. The principal objection to this theory is that no fragments of fluor-spar vases have been found in Rome or its vicinity. Vessels of murra were at one time considered by the Romans as of inestimable value.

Musci (mus'si), *n. pl.* [NL., pl. of L. *muscus*, moss; see *moss*.] A large class of cryptogamous plants of the group *Muscineae* or *Bryophyta*; the mosses. They are low tufted plants, a few inches in height, always with a stem and distinct leaves, producing spore-cases (sporangia) which usually open by a terminal lid and contain simple spores alone. The germinating spore gives rise in the typical families to a filamentous conferva-like prothallium, upon which is produced the leafy plant, these together constituting the sexual generation or oophyte. The sexual organs are antheridia and archegonia, and from the fertilized oosphere proceeds the sporogonium or "moss-fruit," which in itself comprises the non-sexual generation or sporophyte. The sporogonium or capsule, which is rarely indiseiscent or splitting by four longitudinal slits, usually opens by a lid or operculum; beneath the operculum, and arising from the mouth of the capsule, are commonly one or two rows of rigid processes, collectively the peristome, which are always some multiple of four; those of the outer row are called *teeth*; those of the inner, *cilia*. Between the rim of the capsule and the operculum is an elastic ring of cells, the annulus. The *Musci* are classified under four orders—the *Bryaceae* or true mosses (which are further divided into acrocarpous, or terminal-fruited, and pleurocarpous, or lateral-fruited), *Phascaceae*, *Andræaceae*, and *Sphagnaceae*. See cut under *moss*.

Muscicapidae (mus-i-kap'i-dæ), *n. pl.* [NL., < *Muscipapa* + *-idae*.] A family of Old World oscine passerine birds, typified by the restricted genus *Muscipapa*; the flycatchers. They are cichonorphic turdiform or thrush-like *Passeres*, normally with 10 primaries, 12 rectrices, scutellate tarsi, and a gryanian bill of a flattened form, broad at the base, with a ridged culmen and long rictal vibrissae. Their characteristic habit is to capture insects on the wing. None are American, though many American fly-catching birds of the setophagine division of *Sylviolidae* and of the clamatorial family *Tyrannidae* have been included in *Muscicapidae*. Upward of 60 genera and nearly 400 species are placed in this family in its most restricted sense.

It is now commonly restricted to forms with short three-jointed antennae, the third joint of which is setose; the proboscis normally ending in a fleshy lobe and the palpi generally projecting; five abdominal segments; two tarsal pulvilli; and no false vein in the wing. The *Muscidae* comprise more than a third of the order *Diptera*, and are divided into numerous subfamilies, which are regarded as families by some writers. They are primarily divided into *Culicinate* and *Acalyptrate*, according as the tegulae are large or very small.

The species are numerous, all South American. *M. rufivertex* and *M. flavinucha* are examples.

muscle (mus'l), *n.* [Early mod. E. also *muskle*; < F. *muscle* = Pr. *muscle*, *moscle* = Sp. *músculo* = Pg. *músculo* = It. *múscolo* = D. G. Sw. F. *souris*, a mouse, formerly the brawn of the arm, Corn. *logoden fer*, calf of the leg, lit. mouse of leg; the more prominent muscles, as the biceps, having, when in motion, some resemblance to a mouse; see *mouse*. Hence *muscle*, *muscel*. The pron. mus'l instead of mus'kl is prob. due to the ult. identical *muscle*, *muscel*, where, however, the pron. of *r* in *-cle* as 'soft' is irregular, though occurring also in *corpuscule*.] 1. A kind of animal tissue consisting of bundles of fibers whose essential physiological characteristic is contractility, or the capability of contracting

2. A certain portion of muscle or muscular tissue, having definite position and relation with surrounding parts, and usually fixed at one or both ends. Any one of the separate masses or bundles of muscular fibers constitutes a muscle, which as a whole and in its subdivisions is enveloped in fascial connective tissue and usually attached to the part to be moved by means of a tendon or sinew. Muscles are for the most part attached to bones, with the peristomium of which their tendons are directly continuous. The most extensive or most fixed attachment of a muscle is usually called its *origin*; the opposite end is its *insertion*. Individual muscles not only change their shape during contraction, but are of endlessly varied shapes when at rest, indicated by descriptive terms, as *conical*, *fusiform*, *peniform*, *diastriac*, *deltoid*, etc., besides which each muscle has its specific name. Such names are given from the attachments of the muscle, as *sternocleidomastoid*, *oculohyoid*; or from function, as *flexor*, *extensor*; or from position, as *pectoral*, *gluteal*; or from shape, as *deltoid*, *trapezoid*; or from some other quality or attribute, in an arbitrary manner. Circular muscles are those whose fibers return upon themselves; they constitute sphincters, as of the mouth, eyelids, and anus. The swelling part of a muscle is called its *belly*; when there are two such, separated by an intervening tendon, the muscle is *double-bellied* or *diastriac*. Muscles whose fibers are set obliquely upon an axial tendon are *peniform* or *bipenniform*. Muscles whose fibers are all parallel are called *simple* or *rectilinear*; those whose fibers intersect or cross each other are called *compound*. Muscles which act in opposition to one another are termed *antagonistic*; those which concur in the same action are termed

OSp. musar* = *It. musare*), ponder, muse, dream, *F. loiter*, trifle, dawdle; origin uncertain; prob. same as *It. mussare*, mutter, mumble, *F. dial.* (Walloon) *muser*, hum, buzz, *L. musare*, *mussare*, *L. mussare*, murmur, mutter, be in uncertainty; cf. *Norw. musa*, *mussa*, *mysja*, mutter, whisper; *Gr. μῦζεν*, mutter; ult., like *mum*, mumble, mutter, etc., imitative of a low indistinct sound. Another etymology (Diez, Skeat) rests on *It. musare*, 'gape about,' explained as orig. 'sniff as a dog' (cf. *F. muser*, begin to rut), *L. musare* (= *It. muso*), the mouth, muzzle, snout (whence dim. *musel*, *mosel*, *ME. mosel*, *E. muzzle*), *L. morsus*, bite, *ML.* also muzzle, snout, beak: see *muzzle*, *mouse*. OSp.* and *It.* forms, in this view, must be borrowed from the *OF.*, a thing in itself highly improbable at a date so early, and sufficient, with the improbability of such a transfer of notions, to disprove this explanation. Muse (mūz), *n.* [*OF. muse*, *F. muse* = *Pr. Sp. Pg. It. musa* = *D. musse* = *G. muse* = *Sw. Dan. muse*, *L. musa*, *Gr. μῦσα*, *Æolie ποῖσα*, *Doric μῦσα*, *Laconian μῦσα* or *μῦά*, a Muse (see def. 1), hence also music, song, eloquence, in pl. arts, accomplishments, and in general fitness, propriety; prob. contr. of **μῦοσα* (reg. contr. *μῦσα*), fem. ppr. of **μῦεν*, a defective verb (perf. *μῦ-*

μαα, part. *μῦαός*, pres. mid. *μῦσθαι*), strive after, seek after, attempt, long for, desire eagerly, covet, etc. The lit. meaning of *ποῖσα* is sometimes given as 'inventress' (as ancient writers assumed), from the sense 'invent' inferred from the sense 'seek after'; but the term more prob. referred to the emotion or passion, the "fine frenzy," implied in the verb in the usual sense 'strive after' (*μῦαός*, excited), and in its derivatives, among which are counted *μῦεσθαι*, be in a frenzy, *μῦαία*, frenzy, madness, *μῦαίτις*, a seer, prophet, etc.: see *mania*, *Mantis*. Hence *museum*, *music*, *mosaic*, etc.] 1. In *Gr. myth.*, one of the daughters of Zeus and Mnemosyne, who according to the earliest writers were goddesses of memory, then inspiring goddesses of song, and according to later ideas divinities presiding over the different kinds of poetry, and over the sciences and arts, while at the same time having as their especial province springs and limpid streams. Their number appears in the *Ionic* poems not to be fixed; later it seems to have been put at three, but afterward they are always spoken of as nine: *Clio*, the Muse of heroic exploits, or of history; *Euterpe*, of Dionysiac music and the double flute; *Thalia*, of gaiety, pastoral life, and comedy; *Melpomene*, of song and harmony, and of tragedy; *Terpsichore*, of choral dance and song; *Erato*, of erotic poetry and the lyre; *Polymnia* or *Polyhymnia*, of the inspired and stately hymn; *Urania*, of astronomical and other celestial phenomena; and *Calliope*, the chief of the Muses, of poetic inspiration, of eloquence, and of heroic or epic poetry. The Muses were intimately associated in legend and in art with Apollo, who, as the chief guardian and leader of their company, was called *Musiagetes*.

In this city [Cremona] did that famous Poet [Virgil] consecrate himself to the *Muses*. *Corjay*, *Credities*, I, 140.

Hence—2. [*cap. or l. c.*] An inspiring power; poetic inspiration: often spoken of and apostrophized by poets as a goddess.

O for a *Muse* of fire, that would ascend
The brightest heaven of invention!
Shak., *Hen. V.*, i, 1, 1, 1.

Brought death into the world, and all our woe, . . .
Sing, heavenly *Muse*.
Milton, *P. L.*, i, 6.

3. A poet; a bard. [Rare.]

So may some gentle *Muse*
With lucky words favour my destined urn;
And, as he passes, turn
And bid fair peace be to my subtle shroud.
Milton, *Lycidas*, l. 19.

As when a crew of gallants watch the wild *muse* of a Bore,

The old proverb . . . "Tis as hard to find a hare without a *muse* as a woman without a scuse."
Greene, *Thieves Falling Out* (*Harl. Misc.*, VIII, 387). (*Nares*.)

1. A traditional story in which the operations of natural forces and occurrences in human history are represented as the actions of individual living beings, especially of men, or of imaginary extra-human beings acting like men; a tale handed down from primitive times, and in form historical, but in reality involving elements of early religious views, as respecting the origin of things, the powers of nature and their workings, the rise of institutions, the history of races and communities, and the like; a legend of cosmogony, of gods and heroes, and of animals possessing wondrous gifts.—2. In a looser sense, an invented story; something purely fabulous or having no existence in fact; an imaginary or fictitious individual or object; as, his wealthy relative was a mere *myth*; his having gone to Paris is a *myth*. *Myth* is thus often used as an euphemism for *falsehood* or *lie*. = *Syn.* I. *Myth, Fable, Parable*. See the quotation.

What is a *myth*? A *myth* is, in form, a narrative; resembling, in this respect, the *fable*, *parable*, and *allegory*. But, unlike these, the idea or feeling from which the *myth* springs, and which, in a sense, it embodies, is not reflectively distinguished from the narrative, but rather is blended with it; the latter being, as it were, the native form which the idea or sentiment spontaneously assumes. Moreover, there is no consciousness, on the part of those from whom the *myth* emanates, that this product of their fancy and feeling is fictitious. The *fable* is a fictitious story, contrived to inculcate a moral. So the *parable* is a similitude framed for the express purpose of representing abstract truth to

the imagination. Both *fable* and *parable* are the result of conscious invention. In both, the symbolical character of the narrative is distinctly recognized. From the *myth*, on the contrary, the element of deliberation is utterly absent. There is no questioning of its reality, no criticism or inquiry on the point, but the most simple unreflecting faith.

G. P. Fisher, *Supernatural Origin of Christianity*, vi.

They form slimy yellow, brown, or purple (never green) masses of motile protoplasm during the period of active growth, and are then destitute of cell-wall and nucleus. Under certain conditions they secrete a cellulose wall and pass into a resting state. This resting state is brought about either by the absence of the requisite moisture, producing larger, somewhat irregular masses, the so-called sclerotium stage, or when the plasmodium seems to have concluded its vegetative period, the protoplasm then becoming heaped into a mass which breaks up internally into a large number of rounded bodies, the spores, each one of which is provided with a cell-wall. Under proper conditions these spores burst their walls and become motile nucleated masses of protoplasm (swarm-spores) which divide separately by simple fission. After a few days two or more of these swarm-spores coalesce and form new plasmodia, which differ only in size from the original. They occur on decaying logs, tan-bark, decaying mosses, etc. See *Mycetozoa*.

1. The fourteenth letter and eleventh consonant in the English alphabet, having a corresponding place also in the alphabets from which ours comes. The comparative scheme of forms in these alphabets and in the Egyptian (see A) is as follows:

The value of the character has been the same through the whole history of its use. It stands for the "dental" nasal, the nasal sound corresponding to *d* and *t*, as does *m* to *b* and *p*, and *ng* to *g* and *k*. This sound, namely, implies for its formation the same check or mute-contact as *d* and *t*, with sonant vibration of the vocal cords as in *d*, and further with unclosure of the passage from the mouth into the nose, and nasal resonance there. Among the nasals, it is by far the most common in English pronunciation (more than twice as common as *m*, and eight times as common as *ng*). While all the nasals are semivocalic or liquid, *n* is the only one which (like *l*, but not more than half as often) is used with vocalic value in syllable-making; namely, in unaccented syllables, where an accompanying vowel, formerly uttered, is now silenced: examples are *token*, *rotten*, *open*, *lesson*, *reason*, *aven*; such form, on an average, about one in eight hundred of English syllables. The sign *n* has no variety of sounds: but before *ch*, *j*, in the same syllable (as in *inch*, *hinge*) it takes on a slightly modified—a palatalized—character; and similarly it is gutturalized, or pronounced as *ng*, before *k* and *g* (hard), as in *ink*, *finger*; and its digraph *ng* (see *g*) is the usual representative of the guttural or back-palatal nasal, which in none of our alphabets has a letter to itself. *N* is doubled under the same circumstances as other consonants, and in a few words (as *kēn*, *damm*, *hyan*) is silent. In the phonetic history of our family of languages, *n* is on the whole a constant sound: that is to say, there is no other sound into which it passes on a large scale; but its loss, with accompanying vowel-modification, has been a frequent process.

A word by which a person or thing is denoted; the word or words by which an individual person or thing, or a class of persons or things, is designated, and distinguished from others; appellation; designation; designation. In most communities of European civilization at the present day the name a person bears is double—consisting of the family name or surname and the (Christian or distinctively personal name, which latter ordinarily precedes the surname, but in some countries stands last. Either of these name-elements may and (the personal name especially) often does consist of two or more names as component parts. An ancient Roman of historical times had necessarily two names, one distinguishing his family or gens, the *nomen*, or *nomen gentilitium*, and the other, the *praenomen*, distinguishing the individual: as, *Caius Marius*—that is, *Caius* of the gens of the *Marii*. Every Roman citizen belonged also to a familia, a branch or subdivision of his gens, and hence had or might have a third name, or *cognomen*, referring to the familia. This cognomen was always borne by men of patrician estate; and in the case of men of distinction a fourth name or epithet (*cognomen secundum*, or *agnomen*) was sometimes added, in reference to some notable achievement of the individual: thus, *Lucius Cornelius Scipio Asiaticus* was *Lucius* of the *Scipio* branch of the *Cornelian* gens, who had won personal distinction in Asia. Women as a rule bore only the feminine form of the nomen of their gens: as, *Cornelia*, *Tullia*. But sometimes, especially at a comparatively late date, they received also an individual praenomen, which was the feminine form of the praenomen of

the husband, or, still later, was given to them, as in the case of boys, in infancy.

A part of an early Christian or an Oriental church or basilica, at the end furthest from the bema or sanctuary, and nearest to the main entrance. It was originally separated from the nave merely by a railing or screen; but after the earliest Christian centuries it was generally divided from the church proper by a complete wall, in which were the main entrance-doors to the church, the narthex thus forming a capacious and lofty vestibule of the full width of the church. In primitive times the narthex was the part of the church to which the catechumens, the energumens, and the class of penitents called *audientes* or hearers were admitted. Sometimes it was set apart for the women of the congregation. Occasionally it was double, in which case the inner division was called the *esonnarthex* and the outer division the *exonarthex*. In the church-building of western Europe, in certain types of monastic churches, notably in those of the Benedictines and Cistercians, the narthex persisted until the end of the twelfth century, and often formed a very important architectural feature, as in the splendid example in the great abbey-church of Vézelay, France. Also called *antechurch*, *ante nave*, *pronaos*. See diagram under *bema*. 2. In *antiq.*, a small box or casket for unguents or perfumes.—3. Of or pertaining to the nose or nostrils; nasal; rhinal. — 2. Uttered with resonance in the nose, or with admission of the expelled air into the nasal passages, by relaxation or dropping of the palatal veil that shuts them off from the pharynx. A nasal sound uttered with complete closure of the mouth-organs is a nasal stop, or click, or mute, or oftenest called a nasal merely; such in English are *n*, *m*, *ng*, uttered respectively in the mouth positions of *d*, *b*, *g*. There are apt to be in any language as many such as there are positions of mute-closure; thus, in Sanskrit there are five. A nasal uttered in a vowel-position of the mouth-organs is a nasal vowel; such are the French *an*, *on*, *in*, *un*, the Portuguese *ão*, etc. Nasal semivowels are also possible. And sometimes the whole utterance is rendered more or less nasal (the "nasal twang") by habitual relaxation of the velar closure.

(a) In *anat.*, the nasal passages; the hollow interior or cavity of the nose. In man the nasal fossæ are right and left, separated by the nasal septum, and each is subdivided into three fossæ or meatus, superior, middle, and inferior. (b) In *ornith.*, the depressions upon the bill of a bird in which the external nostrils open. These are usually well-marked fossæ at or near the base of the bill, on either side of the culmen, naked or filled in with feathers, or arched over by an operculum or nasal scale; their characters are often of zoological importance. See cuts and diagram under *bill*.—**Nasal helmet**, the helmet of the early middle ages to which a nasal was attached. See II., 1.—**Nasal index**. See *craniometry*.—**Nasal meatus**. See *meatus*.—**Nasal plate**, in *herpet.*, one of the special plates of the head of a reptile through or between which the nostrils open; a nasal.—**Nasal point**, in *cranion.*, the nasion.—**Nasal scale**, in *ornith.*, the horny operculum of a bird's nostril; a naricorn; a rhinotheca.—**Nasal septum**, the partition between the right and left nasal fossæ, in man complete and consisting of the perpendicular plate of the ethmoid bone or mesethmoid, the vomer, and a large cartilage called *triangular*. **Nasal spine**, a spinous process of bone of the nose. Three such are named in man: (a) *frontal*, a process of the frontal bone in part supporting the two nasal bones; (b) *anterior*, a median process of each maxillary bone, together forming one spine which projects at the base of the outer nostrils or anterior nares; (c) *posterior*, a corresponding median process of the conjoined palate-bones in the floor of the posterior nares, at the root of the uvula. The last two processes are sometimes called *prenasal* and *postnasal*. The anterior process has some ethnological significance, being best developed in the higher races of men, and is also one of several datum-points in craniometry.—**Nasal suture**, in *entom.*, the impressed line dividing the clypeus from the front: same as *clypeal suture* (which see, under *clypeal*).—**Nasal tube**, in *ornith.*, a tubular naricorn or rhinotheca, such as occurs in the petrel family and some of the goat-suckers.

Nasals (adjustable), 13th century.

2. A sound uttered through or partly through the nose; especially, a nasal mute or stop, as *m*, *n*, *ng*.—3. In *anat.*, one of the nasal bones. In the higher vertebrates they are a pair of bones of the surface of the skull, in relation with the frontal, lacrymal, or maxillary bones, covering in more or less of the nasal cavity. They are very variable in shape in different animals, less so in position and relations; in man they form the bridge of the nose. In the osseous fishes different bones have been identified as representatives of the nasals. According to Cuvier, they are a pair of separated small turbinate bones in front of the frontals, called by others *turbinals*. According to Owen, they are represented by an unpaired projecting bone in front of the frontals, more generally considered to be the ethmoid. The nasals were regarded by Owen as forming the neural spine of the foremost, rhinencephalic, or nasal vertebra. See cuts under *craniofacial*, *Crotalus*, *Lepidosiren*, *Auara*, and *holorhina*.

are on the descending scale of strength. *Nasty* is the
strongest word in the language for that which is offensive
to sight, smell, or touch by the quality of its uncleanness

anything in America; on the contrary, the word is con-
sidered too strong for ordinary or delicate use, and *foul* is
used of bad weather. All the words apply to that which
is filled or covered in considerable degree with anything
offensive. The moral uses of the word correspond with
the physical.

Wherefore, since neither all things are produced fortuitously, or by the unguided mechanism of matter, nor God himself may reasonably be thought to do all things immediately and miraculously, it may well be concluded that there is a plastic *nature* under him, which as an inferior and subordinate instrument doth drudgingly execute that part of his providence which consists in the regular and orderly motion of matter; yet so as that there is also besides this a higher providence to be acknowledged, which, presiding over it, doth often supply the defects of it, and sometimes overrule it; forasmuch as this plastic *nature* cannot act electively nor with discretion.

Cudworth, *Intellectual System*, l. 3.

Nature never did betray
The heart that loved her.
Wordsworth, *Pintern Abbey*.

3. The metaphysical principle of life; the power of growth; that which causes organisms to develop each in its predeterminate way. Aristotle defines *nature* as the principle of motion in those things that move themselves, meaning by motion especially generation and corruption. Inasmuch as the most striking characteristic of growth is its regularity, *nature* is also conceived by Aristotle as the principle of inward necessity, as opposed to constraint on the one hand and to chance or freedom on the other. Hence *nature* is in literature frequently contrasted with *fat* and with *compulsion*, as well as with *fortune* and *free election*.

There are in sublunary bodies both constant tendencies and variable tendencies. The constant Aristotle calls *nature*, which always aspires to good, or to perpetual renovation of form as perfect as may be, though impeded in this work by adverse influences, and therefore never producing anything but individuals comparatively defective and sure to perish. The variable he calls spontaneity and chance, forming an independent agency inseparably accompanying *nature* — always modifying, distorting, frustrating the full purposes of *nature*. Moreover, the different natural agencies often interfere with each other, while the irregular tendency interferes with them all. So far as *nature* acts in each of her distinct agencies, the phenomena before us are regular and predictable; all that is uniform, and all that, without being quite uniform, recurs usually or frequently, is her work. But, besides and along with *nature*, there is the agency of chance and spontaneity, which is essentially irregular and unpredictable.

Grote, *Aristotle*, iv.
Cel. Let us sit and mock the good housewife Fortune,
... Those that she makes fair she scarce makes honest,

Nature in the abstract is the aggregate of the powers and properties of all things. *Nature* means the sum of all phenomena, together with the causes which produce them; including not only all that happens, but all that is capable of happening; the unused capabilities of causes being as much a part of the idea of *nature* as those which take effect.
J. S. Mill.

Hobbes, *Leviathan*, ii. 31.

navigation (nav-i-gā'shon), *n.* [= F. *navigation* = Sp. *navegacion* = Pg. *navegação* = It. *navigazione*, *navigazione*, < L. *navigatio*(-n), a sailing, a passing over in a ship, < *navigare*, sail: see *navigate*.] 1. The act of navigating; the act of moving on water in ships or other vessels; sailing: as, the *navigation* of the northern seas; also, by extension, the act of "sailing" through the air in a balloon (see *aërial navigation*, below).—2. The science or art of directing the course of vessels as they sail from one part of the world to another. The management of the sails, etc., the holding of the assigned course by proper steering, and the working of the ship generally, pertain rather to seamanship, though necessary to successful navigation. The two fundamental problems of navigation are the determination of the ship's position at a given moment, and the decision of the most advantageous course to be steered in order to reach a given point. The methods of solving the first are, in general, four: (1) by reference to one or more known and visible landmarks; (2) by ascertaining through soundings the depth and character of the bottom; (3) by calculating the direction and distance sailed from a previously determined position (see *dead-reckoning*, *log*, and *compass*); and (4) by ascertaining the latitude and longitude by observations of the heavenly bodies. (See *latitude* and *longitude*.) The places of the sun, moon, planets, and fixed stars are deduced from observation and calculation, and are published in nautical almanacs (see *almanac*), the use of which, together with logarithmic and other tables computed for the purpose, is necessary in reducing observations taken to determine latitude, longitude, and the error of the compass.

"The Kennet *Navigation*"—a very old canal, which connects the waters of the East with those of the West country. *The Academy*, July 6, 1889, p. 13.

Act of Navigation, an act which was first passed by the British Parliament in 1651, under Cromwell's administration, was reenacted in 1660, and remained in force, with various modifications; it was greatly altered in 1825 and at other times, and finally repealed in 1849. Its object was to encourage the British merchant marine by reserving to it the whole of the import trade from Asia, Africa, and America, and the chief part of that from Europe. This end it accomplished by denying to foreign vessels the right to bring to England any goods not produced in their respective countries, and also by restrictions in regard to fisheries and the coasting-trade. The act was aimed especially at the Dutch, who possessed at that time almost a monopoly of the carrying-trade of the world.—**Aërial navigation**, the sailing or floating in the air by means of balloons; particularly, the principles, problems, and practice involved in the attempt to pass from place to place through the air by means of balloons capable of being steered.—**Arterial navigation**. See *arterial*.—**Inland**

navigation, the passing of boats or vessels on rivers, lakes, or canals in the interior of a country; conveyance by boats or vessels within a country.—**Navigation laws**, the various acts and regulations in any country which define the nationality of its ships, the manner in which they shall be registered, the privileges to which they have claim, and the conditions regulating the engagement of foreign ships in the trade of the country in question, either as importers and exporters or with relation to coasting-traffic. The first British navigation law of importance was enacted under Richard II. It provided that no merchandise should be imported into England or exported from the king's realms by any of his subjects except in English ships, under penalty of forfeiture of vessel and cargo.

In the merchant marine the commanding officer usually navigates the vessel; in men-of-war, of nearly all nationalities, one of the line-officers or executive officers (in the United States navy the third in rank) is detailed for that duty. In the United States navy the navigator, in addition to his other duties, has charge of the log-book, of the steering-gear, of the anchors and chains, and of the stowage of the hold, and has also general supervision of the ordnance and ordnance-stores.

In the United States the control of the navy is vested in a cabinet officer called the Secretary of the Navy, the head of the Navy Department. (See *department*.) The government of the royal navy is vested in the Board of Admiralty, or lords commissioners for discharging the office of lord high admiral. The board consists of the following members: the first lord, who has supreme authority, and is a member of the cabinet; the senior naval lord, who directs the movements of the fleets, and is responsible for their discipline; the second naval lord, who superintends the manning of the fleet, coast-guard, transport department, etc.; the junior naval lord, who deals with the victualing of the fleets, medical department, etc.; a civil lord, member of Parliament, who is also connected with the civil branch of the service; a controller of the navy; and an expert civilian. Under the board is a financial secretary, changing, like the five lords, with the government in power. There is a permanent secretary, and a number of heads of departments. Some nebulae are resolvable into clusters, generally globular, in which the separate stars can be distinguished. These are for the most part in the Galaxy. The remaining nebulae are of two types, according as their spectra are continuous or consist of bright lines. The latter class are greenish-blue, have fairly definite outlines, and show a tendency to concentration toward the galactic circle. Of the three brightest lines in their spectra two are unidentified, and one is the F line of hydrogen. There are six or seven other faint lines, two of them hydrogen. There are besides nebulous stars, or stars with haze about them which in some cases is of vast proportions. The continuous spectra indicate that all these nebulae are solid, liquid, or, if gaseous, enormously condensed. The nebulae in Andromeda, Orion, and Argo are visible to the naked eye. Such as must be; that cannot be otherwise. (a) As an inference, evidently of such a form that every like inference from true premises will always yield a true conclusion, in every state of facts. (b) As a proposition or fact, true or taking place not merely in the actual state of things, but in every possible state of things (within some meaning of the word *possible*). Will come when it will come.
Shak., J. C., ii. 2. 36.

3. In law: (a) Requisite for reasonable convenience and facility or completeness in accomplishing the purpose intended: as, the land *necessary* for building a railroad. (b) Naturally and inseparably connected in the ordinary course: as, *necessary* consequences. 4. Acting from compulsion or the absolute determination of causes: opposed to *free*. See *free*.

Agents that have no thought, no volition at all, are in every thing *necessary* agents.
Locke, *Human Understanding*, II. xvi. 13.

Necessary, Essential, Requisite, Needful**. The following remarks refer to the application of the words to ordinary practical affairs, not to philosophy. *Necessary* is so general a word that it covers all the others, and has the additional sense, which they do not have, of *inevitable*. *Essential* is an absolute word, noting that which is a part of the chief end of the action, or of every mode of bringing that end about. *Requisite* is less strong than *essential*, and *needful* is less strong still; yet each is strong and emphatic, applying to that which is imperatively needed. *Needful* generally applies to concrete, and often to temporary, things: as, knowledge of the countries visited is *requisite*, and even *essential*, to enjoyment of travel, but money is *needful* in order to be able to travel at all. *Needful* is often applied to that which must be supplied to produce or effect a perfect state or action.

II. *n.*; pl. *necessaries* (-riz). 1. Anything that is necessary or indispensable; that which cannot be disregarded or omitted: as, the *necessaries* of life.

See *internal*.—**Legal necessity**, constraint by the law; also, that which one is constrained by the law to do, irrespective of consent. 2. Specifically, in law, the failure to exercise that degree of care which the law requires for the protection of those interests of other persons which may be injuriously affected by the want of such care. If such failure directly results in injury to the interests of another person, who did not by his own negligence contribute to the result, the negligence is *actionable negligence*. If the failure to exercise due care is wilful, liability is incurred irrespective of contributory negligence, but the failure may still be treated at the option of the person injured as mere negligence, so far at least as concerns the liability of the person actually guilty of it, and in some cases also for the purpose of holding his employer liable. By a rule of law which obtains in some of the United States, the person injured may recover notwithstanding his own negligence if it was slight as compared with that of the defendant (*comparative negligence*). *Contributive* or *contributory negligence* is negligence, on the part of the person injured, which contributed to produce the injury. *Gross negligence* is the failure to exercise even slight care, and is usually measured by reference to that degree of care which every person of ordinary sense, however inattentive, takes of his own interests. *Ordinary negligence* is the failure to exercise ordinary care, usually measured by reference to that degree of care which a man of common prudence and capable of governing a family takes of his own interests. *Slight negligence* is the failure to exercise a high degree of care, usually measured by reference to that diligence with which a circumstance and thoughtful person would attend to his own interests. Whether these three degrees are proper distinctions to be observed as a test of liability for damages is much disputed, but there is no question that the law fully recognizes in a general way the corresponding degrees of care as required of persons in various different relations, nor that degrees of neglect must be noticed by the law in determining other questions than that of liability for damages, as good faith, fidelity, etc.

3. Lack of attention to niceties or conventionalities, especially of dress, manner, or style; disregard of appearances: easy indifference of manner.

=*Syn.* 1. *Heedlessness*, *inconsiderateness*, *thoughtlessness*.—1 and 2. *Negligence*, *Neglect*, *Remissness*, *Inattention*, *Inadvertence*, *Over-sight*, *Indifference*. As contrasted with *neglect*, *negligence* generally expresses the habit or trait, and *neglect* the act. *Inadvertence* and *oversight* expressly mean that there was no intention of neglect: *indifference* lies back of action in the failure to care, such failure being generally blame-worthy. *Remissness* is careless neglect of duty. *Inattention* is a failure, generally culpable, to bring the mind to the subject. See *neglect*, *v.*, and *negligent*.

negligent (nĕg-li-jent), *a.* [*< ME. negligēnt*, < OF. *negligent*, F. *négligent* = Sp. Scott, L. of L. M., l. 10.

Negligent escape, the escape of a prisoner without the knowledge or consent of the sheriff, as distinguished from escape by permission, called a *voluntary escape*. The importance of the distinction is in the right of the sheriff to retake the prisoner, and in the fact that in case of mesne process retaking before suit brought by the creditor against the sheriff is a defense; whereas for a voluntary escape the sheriff is liable absolutely. = *Syn.* *Negligent*, *Neglectful*, *Remiss*, *Heedless*, *Thoughtless*, *Inattentive*, *regardless*, *indifferent*, *slack*. Of the first five words, *remiss* is the weak-

est; it especially applies to failure to attend to what is considered duty. *Negligent* is generally applied to inattention to things, *neglectful* to inattention to persons. *Neglectful*, by derivation, is stronger than *negligent*, but the difference is really small. *Heedless, thoughtless, etc.*, indicate lack of heed, care, attention, thought, etc., where they are needed or due. All these words may apply to a particular occasion of failure, or indicate a habit or a trait of character: as, he is very *heedless*. See *neglect, v.*, and *negligence*.

(*Parsons*.) The peculiar effects of *negotiability* are, in the rule of law, that a transferee in good faith and for value, in the ordinary course of business and before maturity, can usually recover of the maker, drawer, or acceptor, irrespective of defenses the latter might have against the transferee; and that a transferee by indorsement can recover of the indorser in case of default of the maker, acceptor, or drawer, if due notice thereof was given. A sealed instrument, unless issued by a corporation or state, is not usually deemed negotiable.

Most of these worms are endoparasitic at one or another stage of their life or during the whole of it; those which are not are mostly of minute size. There are several distinct families, and most of them have popular names. Thus, the *Ascariidae* contain the roundworms and pinworms of the human rectum. The same plant, to which Dawson later gave the name of *Nematophyton*, was examined by Carruthers and placed among the *Algae*, he considering it an anomalous alga and one which it was not possible to correlate with certainty with any known alga. Later (in 1875) the same plant was discovered by Hlicks much lower in the geological series, namely, in the Denbighshire grits (a rock occupying a rather uncertain position, but probably near the limit between Upper and Lower Silurian). The specimens from this position have been identified with the *Nematophycus* of Carruthers (the *Prototaxites* of Dawson) by Etheridge, who considers it as unquestionably forming a portion of a colossal seaweed, whose habits resemble those of the North Pacific species of the genus *Nereocystis* and the arborescent *Lesonnia*.

Nemean games, one of the four great national festivals of the ancient Greeks (the others being the Olympian, Pythian, and Isthmian games). These games were celebrated at Nemea in the second and fourth years of each Olympiad, near the temple of the Nemean Zeus, some (Doric) columns of which are still standing. According to the mythological story, the games were instituted in memory of the death of the young hero Archemoros or Opheltes by the bite of a serpent as the expedition of "the Seven against Thebes" was passing through the place. They were formerly classed with the plathelminths, and known as the *rhynchocoelous turbellarians*; but they are more nearly related to annelids. They have well-developed muscular, blood-vascular, and nervous systems. Most of the species are dioecious, and some are viviparous. There are commonly ciliated pits on the head. The object known as a *pilidium* is the free-swimming larva of a nemertean. These worms vary greatly in general outward aspect, in size, and in habits. Some are minute, others very long. (See *Lineidae*.) They live for the most part in the sea, but some live in the mud or on land, and some are parasitic. The *Nemertea* are often divided into two orders, called *Anopla* and *Enopla* according as the proboscis is armed with stylets or unarmed. Of the latter order is the family *Nemertidae* (or *Amphiporidae*); the *Lineidae* and *Cephalothricidae* are anoplean. Another division is into *Hoplomenertea*, *Schizomenertea*, and *Palaeomenertea*. See *Rhynchocoela*, and cuts under *pilidium* and *proctocha*. Also written *Nemertinea*.

Nemesis (nem'e-sis), *n.* [*L. Nemesis*, < Gr. *Nēmeis*, a goddess of justice and divine retribution, < *νέμεν*, deal out, distribute, dispense: see *nomē*, *nomē*, etc.] *1.* In *Gr. myth.*, a goddess personifying allotment, or the divine distribution to every man of his precise share of fortune, good and bad. It was her especial function to see that the proper proportion of individual prosperity was preserved, and that any one who became too prosperous or was too much uplifted by his prosperity should be reduced or punished; she thus came to be regarded as the goddess of divine retribution. Sometimes Nemesis was represented as winged and with the wheel of fortune, or borne in a chariot drawn by griffins, and confounded with *Adrasteia*, the goddess of the inevitable.

Hence — *2.* Retributive justice.

Neptune (nep'tūn), *n.* [= F. *Neptune* = Sp. *Fig. Neptuneo* = It. *Nettuno*, < L. *Neptunus*, a sea-god: see *def.*] 1. In *Rom. myth.*, the god of the sea, who came to be identified by the Romans themselves with the Greek Poseidon, whose attributes were transferred by the poets to the ancient Latin deity. In art Neptune is usually represented as a bearded man of stately presence, with the trident as his chief attribute, and the horse and the dolphin as symbols.

2. Figuratively, the ocean.

Ye that on the sands with printless foot
Do chase the ebbing *Neptune*.

Shak., Tempest, v. 1. 35.

3. In *her.*, same as *Triton*.—4. The outermost known planet of the solar system, and the third in volume and mass, though quite invisible to the naked eye. It was discovered in the autumn of 1846. Uranus, the planet next to Neptune, revolving about the sun in eighty-four years, was discovered in 1781; but observations of it as a fixed star were scattered through the eighteenth century. In 1821 Bouvard found that the observations of Uranus could not be satisfied by any theory based on the gravitation of known bodies, and hinted at an undiscovered planet. During the following twenty years further observations satisfied astronomers that such a planet must exist. To find where it could be the problem which two mathematicians, J. C. Adams in England and U. J. J. Leverrier in France, set themselves to solve by mathematics. The calculations of Leverrier assigned the boundaries of a not very large region within which the unknown planet might be. In consequence of the indications of Adams, the astronomer Challis observed the planet Neptune August 4th and 12th, 1846, but, neglecting to work up his observations, failed to recognize it as a planet; while, in consequence of the indications of Leverrier, Galle of Berlin discovered Neptune September 23d, 1846. The orbit of the new planet, having been determined from direct observations, was found to differ excessively from the predictions in all its elements; so much so that Leverrier declared these elements "incompatible with the nature of the irregular perturbations of Uranus." The distance from the sun was 30 times instead of 36 times that of the earth, as predicted; and the orbit, instead of being more elliptical than that of any planet except Mercury, was in fact the most circular of all. When Neptune was discovered by Dr. Galle it was only 1° from the predicted place; but this would not have been so at the epoch to which the calculations referred, and there was nothing in their nature to render them particularly accurate for 1846, so that this coincidence must be regarded as in great measure a happy accident, such as would occur by mere chance once in 180 times. A satellite to Neptune was detected in October, 1846, by Lassell. Its period of revolution is 5 days, 21 hours, and 8 minutes, and its maximum elongation 18". The mass of Neptune, having been calculated from these data, was found to be $\frac{1}{45}$ that of the sun, against predicted values nearly twice as great. With the mass so ascertained, the perturbing action upon Uranus was calculated, and found to satisfy the observations of that planet much better than either Leverrier's or Adams's hypothesis had done. This was because the real action of Neptune upon the orbit of Uranus was of a different kind from what it had been assumed to be, those terms of the mathematical expressions which had been assumed to be the principal ones being really insignificant, and those which had been neglected as insignificant being really the controlling ones. The name *Neptune* was conferred by Encke, Leverrier having signified that he wished it called by his own name. The diameter of Neptune is 37,000 miles. Its distance from the sun is about 2,800,000,000 miles, and its period of revolution about 164 years.—*Neptune's horse*, a fish of the family *Hippocampidae*; a sea-horse.—*Neptune's ruffles*, a reptere.—*Neptune's spoonworm*, a gephyrean, *Thalassena neptuni*.

In *geol.*, formed by water or in its presence. The word is used especially to designate an aqueous origin of certain formations, now generally admitted to be volcanic, but which according to the views of Werner were deposited from water. (See *Huttonian* and *Wernerian*.) A most violent discussion in regard to this subject was carried on, during the latter third of the eighteenth century, by geologists and theologians.

In *Gr. myth.*, a sea-nymph, one of the daughters of Nereus and Doris, generally spoken of as fifty in number. The most famous among them were Amphitrite, Thetis, and Galatea. The Nereids were beautiful maidens helpful to voyagers, and constituted the main body of the female, as the Tritons did of the male, followers of Poseidon or Neptune. They were imagined as dancing, singing, playing musical instruments, wooed by the Tritons, and passing in long processions over the sea seated on hippocamps and other sea-monsters. Monuments of ancient art represent them lightly draped or nude, in poses characterized by undulating lines, harmonizing with those of the ocean, and often riding on sea-monsters of fantastic forms.

nervation (nĕr-vā'shon), *n.* [= F. *nervation*; as *nerve* + *-ation*.] The arrangement or distribution of nerves. Specifically—(a) In *bot.*, the disposition of the fibrovascular bundles in the blades of leaves, the sepals or petals of flowers, the wing-like expansions of samaroid fruits, etc.; a character which has assumed special importance in the study of fossil plants, since it has been proved to have generic rank, while the form and outline of leaves have only specific rank. The

nervation of leaves, as studied and classified by A. P. de Candolle (1827), Giuseppe Bianconi (1838), Baron von Ettingshausen (1854-61), Oswald Heer (1856), and later authors, is based primarily on the relative rank of the nerves, and secondarily on their course through the leaf. As regards the rank of the nerves, the leaves of dicotyledonous plants are usually either pinnately or palmately nerved. This refers to the primary nerves. In pinnately nerved leaves

there is only one primary nerve, the midrib, which may be regarded as a continuation of the petiole, and from which there are given off secondary nerves which proceed at various angles through the blade toward or to its margin. These secondaries may or may not give off other nerves called tertiaries, and even these may produce quaternary nerves. In palmately nerved leaves there arise, usually from the summit of the petiole, two or more (sometimes numerous) more or less divergent primary nerves, which may have nearly equal strength, but more commonly the central one is thickest and may still be denominated the midrib. In the latter case the others are called lateral primaries. Any or all of the primaries of a palmately nerved leaf may give off secondaries as in pinnately nerved leaves, but these more commonly proceed from the outer pair. Leaves of only three primaries are sometimes called *triplinerved*; those of five, *quintuplinerved*. Peltate leaves usually have a peltate nervation, which may be regarded as a modification of the palmate nervation. The peltate nervation is simply a case of palmate nervation in which there are several nearly equal primaries. The terms *penninerved*, *palmatinnerved*, *peltinerved*, and *pedalinerved* were suggested by De Candolle for these several kinds of leaves. As regards the course of the nerves through the blade and their ultimate disposition, the following classes are distinguished: (1) *craspedotrone* [*Gr. κρασπέδον*, edge, margin, + *-δρονος*, < *δραμνιν*, run], the nerves passing directly to the margin of the blade; (2) *campylotrone* [*Gr. καμπτος*, verbal adj. of *καμπτιν*, bend, curve], the nerves curving (usually forward) near the margin, and either losing themselves in the parenchyma, or joining, arching, or otherwise anastomosing within the margin; (3) *brachiotrone* [*Gr. βραχίον*, dim. of *βραχος*, a nose, loop], the nerves forming loops within the blade of the leaf; (4) *acrotrone* [*Gr. ακρος*, at the point], the nerves passing upward and forward and terminating in the apex or point of the leaf; (5) *diatotrone* [*Gr. δεικναι*, a net], the nerves soon dividing up and losing themselves in the general network of the leaf (see explanation of *nerve*, below); (6) *hypodrome* [*Gr. υποη*, a web], the nerves of lower rank than primaries, so lost in the thick, coriaceous tissues of the leaf as to be nearly or quite invisible at the surface; (7) *paraphrone* [*Gr. παραφνη*, a border woven along a robe], a strong nerve passing round the entire margin of the leaf, forming a sort of hem or border; (8) *marginal*, a distinct nerve passing along the margin of the leaf, parallel to it, but separated from it by a narrow interval; (9) *parallelotrone* [*Gr. παράλληλος*,

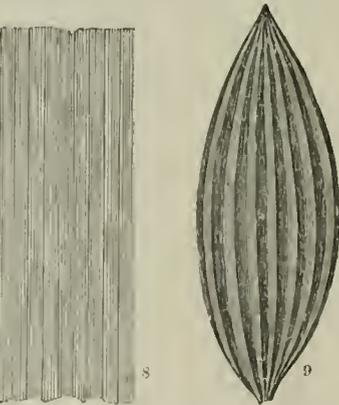

5, palmately nerved brachiotrone paraphrone leaf of *Cerculus Haydenianus*, from the Fort Union group of Montana; 6, palmately nerved leaf of *Hedera Brownii*, from the Cretaceous (Laramie) of Wyoming.

parallel], the nerves running parallel to one another, either longitudinally, as in grasses, or horizontally from the midrib to the margin, as in the banana-tree; (10) *campylotrone*

7, transversely parallelotrone venation of *Macrotaniopsis magnifolia*, from the Trias of Virginia.

parallel], the nerves running parallel to one another, either longitudinally, as in grasses, or horizontally from the midrib to the margin, as in the banana-tree; (10) *campylotrone*

8, longitudinally parallelotrone venation of a fossil palm-leaf, from the Fort Union group of Montana; 9, campylotrone leaf of *Oreodoxites plicatus*, from the Cretaceous (Laramie) of Colorado.

[*Gr. καμπνλος*, curved], the nerves passing in a gentle curve from base to apex of the leaf, the interval between them increasing gradually in width from either end to the middle. The last two classes are almost wholly restricted to monocotyledonous plants. Besides the above, there is the *dichotomous* or *forking* nervation of most ferns and some other plants. From the various nerves as thus described there usually proceed many much finer ones which join and anastomose in various ways, forming a network of meshes of different shapes, usually angular, and either rectangular, trapezoidal, or nearly square, the spaces inclosed by which are known as *areolæ*. To such nerves the term *nerve* has been applied. Physiologically considered, all nerves consist of vascular bundles which pass from the branch through the petiole, if there is one, into the base of the leaf, the primary fascicle of which is subsequently divided up to furnish the various nerves of the leaf, the primary nerves further dividing to supply the secondaries, these to supply the tertiaries, etc., and no nerves or fibers originate within the leaf. (b) In *zool.*, the arrangement or disposition of the nerves, nerves, or veins of an insect's wing; the set or system of nerves as thus arranged; *neurulation*; *venation*. (c) In *anat.*, the way or mode in which

The nerve-fibers are bound together into a primitive bundle called a *funiculus*. The connective tissue between the fibers within the funiculus is the *endoneurium*, and the connective tissue sheathing the funiculus is the *perineurium*. In the larger nerves several funiculi may be bound together into one trunk by connective tissue which forms the *epineurium*. See cut under *median*.

Hence—**2.** A counselor; an adviser.—**3.** In *ornith.*, a genus of parrots having a remarkably long beak: named from the gray head. *Nestor notabilis* is the New Zealand kaka; *N. productus* is another species. The people are of sundry kinds, for there are not only Saracens and idolaters but also a few Nestorian Christians. *Encyc. Brit.*, XXIV. 760.

Nestorian liturgy. See *liturgy*, 3 (3).

II. *n.* **1.** A follower of Nestorius; one who denies the hypostatic union of two natures in one person in Christ, holding that he possesses two distinct personalities, the union between which is merely moral. After the Council of Ephesus the Nestorians obtained possession of the theological schools of Edessa, Nisibis, and Scleucia, and were driven by imperial edicts into Persia, where they firmly established themselves. Later they spread to India, Bactria, and as far as China. About 1400 the greater part of their churches perished under the persecutions of Timur, and in the sixteenth century a large part of the remainder joined the Roman Catholics. These are called *Chaldeans*. See def. 2, and *Nestorianism*.

2. One of a modern Christian body in Persia and Turkey, the remnant of the once powerful Nestorian denomination. They number about 140,000, are subject to a patriarch (the patriarch of Urumiah) and eighteen bishops, recognize seven sacraments, administer communion in both kinds, and have many fasts. Another community of Nestorian origin still exists on the Malabar coast of India, but since the middle of the seventeenth century these are said to have become Monophysites. See *Christians of St. Thomas*, under *Christian*.

The Persian kings were always more favourable to Nestorians, as believing them to deny the True Divinity of our Lord. *J. M. Neale*, *Eastern Church*, i. 142.

Nestorianism (nes-tō'ri-an-izm), *n.* [*<* *Nestorian* + *-ism*.] *In theol.*, the doctrine that in the God-man the two natures, the divine and the human, are not united in one person, and that consequently he possesses two distinct personalities. Nestorianism is at the opposite extreme of Christological doctrine from Monophysitism. It derives its name from Nestorius, patriarch of Constantinople in the fifth century, who was condemned by the third and fourth ecumenical councils (that of Ephesus in 431 and that of Chalcedon in 451) as promulgating teachings which involved this doctrine and as refusing to assent to the decision of the Ephesine Council. See *Theodosius*.

As Eutychianism is the doctrine that the God-man has only the one nature, so *Nestorianism* is the doctrine that He has two complete persons. *Encyc. Brit.*, XVII. 356.

Root unknown.] **I.** *n.* **1.** An open textile fabric, of cotton, linen, hemp, silk, or other material, tied or woven with a mesh of any size, designed or used for entangling animals alive, either by inclosing or by entangling them; a netting or network used as a snare or trap. Nets are of high antiquity, and there are almost as many kinds of them as there are ways in which a piece of netting or a network can be adapted to the capture of animals. It is characteristic of nets to take the game alive, either by surrounding or inclosing it as in a bag or by entangling it in meshes. Many kinds of nets are described and named—from the nature of the game, as *bird-nets*, *butterfly-nets*, *fish-nets*; from the way in which the game is taken, as *gill-net*, *gill-ing-net*; from the way in which the net is handled or worked, as *beating-net*, *dip-net*, *draw-net*, *drag-net*, *drift-net*, *drap-net*, *hand-net*, *landing-net*, *set-net*, *stake-net*, *scow-net*; from the shape of the netting, as *bag-net*, *purse-net*, etc. In the fisheries in which nets are most used, many of them take other names, as *fyke*, *pound*, *seine*, *veil*, *trap*. (See these words and the above compounds.) Nets range in size from a few inches to a mile or more; thus, seines have been made reaching (with the ropes which haul them) 5 miles, and sweeping more than 1,000 acres of water-bottom. The material ranges from the finest silk, muslin, etc., to stout cordage; gut or sinew is sometimes used. The mesh is always made with a fixed, not running, knot. The appliances of nets are numerous; as, buoys or buoy-lines to float one border of the net or indicate the whereabouts of a net under water; sinkers, leads, or lead-lines to sink one border of the net to the bottom of the water; sords or ropes for setting, stretching, hauling, pursuing, etc., often worked by mechanical contrivances, as a windlass operated by horse- or steam-power; poles or stakes for setting, etc. In some kinds of set-nets or veils the staking or paling is so extensive in comparison with the netting that the contrivance is converted into a wooden trap, and is, in fact, called a *trap*. See *net*¹, *v. t.*, 2.

But as a bird, which woe alight
And seeth the mete, but nought the *nette*.
Gower, *Conf. Amant.*, iii.

And *nets* of various sorts, and various snares,

Shak., *Othello*, ii. 3. 367.

Skill'd to retire, and in retiring draw
Hearts after them tangled in amorous *nets*.
Milton, *P. R.*, ii. 162.

3. A light open woven fabric, as gauze or muslin, worn or used as a protection from annoying insects: as, a mosquito-net spread over a bed.—**4.** Machine-made lace of many kinds. The varieties of machine-net formerly made were *chip-net*, *mail-net*, *patent net*, *drop-net*, *spider-net*, *halloon-net*. The modern varieties, named according to the kind of mesh employed, are *vearp-net*, *point-net*, and *bobbin-net*. *Broad net* is woven as wide as the machine will allow. *Quillings* are narrow widths, several being made at one time in the breadth of the machine. *Fancy net* has a gimp pattern worked in by hand (called *lace-darning*) or by the Jacquard attachment.

Here's a bit o' *net*, then, for you to look at before I tie up my pack: . . . spotted and sprigged, you see, beautiful, but yellow—'s been lyin' by an' got the wrong colour.
George Eliot, *Mill on the Floss*, v. 2.

5. A light open meshed bag for holding or confining the hair. Some are made of threads so fine that they are called *invisible nets*.

The hair is usually plaited down on each side of the face and inclosed in a *net* or cowl. *Encyc. Brit.*, VI. 470.

6. Anything formed with interstices or meshes like a net.

7. In *anat.* and *zool.*, a reticulation or cancellation; a network of anastomosing or inosculating filaments or vessels; a web or mesh; a rete.—**8.** In *math.*, a rectilinear figure drawn as follows. For a plane net, four points in a plane are assumed, and through pairs of them, and of points subsequently obtained as intersections of lines, straight lines are drawn. For a net in space, five points are assumed, through triads of which, and of points subsequently obtained as intersections of three planes, planes are drawn.—**Bag-and-stake net**, a kind of net-weir similar to that form of seine sometimes used to take bluefish. In England the bag-and-stake nets are included in the law forbidding the use of fixed engines for the capture of salmon. *Massachusetts Report* (1866), p. 28.—**Baird net**, a form of collecting-net: named from its designer, Prof. S. F. Baird.—**Bar-net**, that part of a stake-net which is hung on stakes in a line at right angles with the shore, and with which the fish first come in contact. See *stake-net*. [*Anna-da.*]—**Brussels net**. (*a*) The pillow-made ground of Brussels application lace. (*b*) A machine-made ground

imitating the above.—**Bull-net**, a large dip-net worked from the rigging by block and tackle, and used in unloading a purse-seine.—**Casting-net**, a fishing-net consisting of a circle of netting varying in diameter from 4 feet to 15 or more. To its circumference are attached, at short intervals, leaden weights. There is a central opening, usually constituted by a ferrule of bone or metal. One end of a long rope passes through this ferrule, and to it are attached numerous cords extending to the lead-rope. The net is used by gathering up the casting-rope in a coil on one arm, and taking the net itself on the other. By a dexterous fling of the arm holding the net, this is thrown in such a way as to spread out completely, and it is sometimes hurled to a distance of many feet, so as to fall flat on the surface of the water. The leads sink immediately, forming a circular inclosure, and imprisoning any fish that happen to be under it at the time. The rope is then hauled in from the other end, causing the whole circumference to pucker inwardly, the leads and pucker coming together in a compact mass. These nets are extensively used in the West Indies and the southern United States.—**Cast-net**, a fishing-net that is cast; a casting-net.—**Cherry-net**, a net spread over a cherry-tree to keep off birds.

To catch a dragon in a *cherry net*,
To trip a tigress with a gossamer,
Were wisdom to it. *Tennyson*, *Princess*, v.

Clue-net, a purse-seine. [*New Jersey.*]—**Collecting-net**, a small seine used for collecting fish for specimens of natural history; a collecting-seine.—**Darned net**, net of any kind, embroidered with either white or colored thread of any material. It differs from *darned embroidery* in giving less solid and uniform opaque surfaces, and in depending more upon the outline formed by a single thread carried through the meshes. See *darned nothing*, under *nothing*.—**Diving-net**, a net arranged somewhat like a fyke, for taking rock-fish, perch, etc. [*New Jersey.*]—**Draft-net**, a haul-seine. [*New Jersey.*]—**Drag-net**, a small seine dragged or hauled in shoal water, one end of the net being fastened in the mud by means of the staff. The drag-net is from 75 to 100 yards long, and 25 to 37 meshes deep, with a mesh of from 14 to 2 inches. The lead-line is provided with heavy lead sinkers, the cork-line with floats.—**Dredge-net**. See *dredge*.—**Drift-net**, a fishing-net which drifts with the tide. Drift-nets are arranged on the same principle as gill-nets (see *gill-net*), except that they are allowed to drift about with the tide instead of being secured to stakes. They are shot or paid out from boats in a straight line, and kept perpendicular by buoys along the top and leads at the bottom, and are drawn out straight across the current by a boat rowed in the proper direction.—**Dutch net**, a pound-net. [*North Carolina.*]—**Gang or hook of nets**. See *gang*.—**Glade net**. See *glade-net*.—**Maltese net**, in *lace-making*, a ground or réseau in which the Maltese cross appears, especially one consisting of octagons each inclosing a Maltese cross, and alternating with elongated hexagons and small triangles, producing a very complex pattern.—**Run net**, darned netting of a simple sort in which the needlework is not elaborately stitched. *A. S. Cole*, *Embroidery and Lace*.—**To run the net**, to feel for fish that may have been caught, by hauling the cork-line of a net without further disturbing its set in the water; run the cork-line hand over hand. The struggling of the fish is readily felt in this way, and they are unkilld as soon as possible, that they may not injure themselves nor be devoured by other fish.—**Water-net**, a fresh-water alga, *Hydrodictyon striatum*. See *Hydrodictyon*.

II. *a.* **1.** Made of netting; as, a *net* fence.—**2.** Resembling netting; having a structure which is like netting—that is, one which has open meshes, large in proportion to the thickness of the threads.—**3.** Caught in a net; netted; as, *net* fish.—**4.** Reticulate or cancellate; netted or net-veined, as an insect's wings.—**Net embroidery**. (*a*) Decorative needlework done upon net as a foundation. (*b*) Decorative work done upon net, but not strictly needlework, as muslin appliqué (which see, under *muslin*).—**Net-mackerel**. See *mackerel*.
net¹ (net), *v.*; pret. and pp. *netted*, *net*, *netting*. [*<* *net*¹, *n.*] **I.** *trans.* **1.** To make as a net; make network of; form into a netting; mesh; knot or weave in meshes.

In medieval times the vestments of the clergy frequently had *netted* coverings of silk. *Drapers' Dict.*, p. 239.

2. To capture or take with a net, as game; insuare, entangle, or entrap in or by means of netting, as any animal. Quadrupeds are not often netted, traps or snares or guns being commonly used for their capture. Birds are netted in several different ways: by springing a net over them; by driving them into a winged and tunneled net, as ducks; by the use of a hand-net on a pole, as in taking insects; and by entangling them in the meshes of a spread net. Fishes, including shell-fish, are netted by every device which can be put into effect by means of network. The use of the net in these cases is, however, in one of two leading methods, entangling and inclosing. In the former of these, the fish swims against a vertical sheet of netting, finds the mesh too small to go through, and is caught by the gills in trying to back out. Insects are netted by collectors in one of two ways: with the butterfly-net, which is a very light bag of silk gauze, etc., on a frame and pole; and with the beating-net, a bag of stout cloth or light canvas on a frame, with a short handle, used to beat or brush the grass and bushes. See *net*¹, *n.*

3. To take as if with a net; capture by arts, wiles, or stratagems; entangle in difficulty; beguile.

And now I am here *netted* and in the toils. *Scott*.

4. To put into or surround with a net for protection or safe-keeping; hold in place by means of a net, as one's hair; veil or cover, as

the head with a net; spread a net over or around, as a fruit-tree to keep off the birds, or a bed to keep out mosquitos.

To leave his favourite tree to strangers, after all the pains he had been at in *netting* it to keep off the birds.

In these cells, which exhibit the beginnings both of a nervous and of a muscular system, the indifferency of such systems is seen; for every single cell is in part nervous, responding to stimuli, and in part muscular, or executive of movements which result from the stimulation of the other part. The motile filaments into which these neuromuscular cells are drawn out are called *fibers of Kleinenberg*. neuropter (nū-rōp'tēr), *n.* [NL.] A Neuropterous insect; a member of the order *Neuroptera*.

Neuroptera (nū-rōp'tēr-ā), *n. pl.* [NL., neut. pl. of **neuropterus*, *<* Gr. *νεῦρον*, nerve, + *πτερόν*, a wing.] An order of the class *Insecta*, founded by Linnæus in 1748. It was originally composed of the genera *Libellula*, *Ephemera*, *Phryganea*, *Hemerobius*, *Myrmeleon*, *Panorpa*, and *Raphidia* (*Raphidia*). The winged termites being included in *Hemerobius*. The group thus constituted has suffered many changes, and entomologists are still far from agreed upon its proper definition. Fabricius founded a distinct order *Odonata* for the Linnean *Libellula* or dragon-flies. Kirby separated the Linnean *Phryganea* or caddis-flies under the ordinal name *Trichoptera*. Erichson founded the order *Pseudoneuroptera* for those Linnean neuropters whose metamorphosis is in-

complete and whose pupæ are active. These eliminations left the *Neuroptera* to consist of the families *Stalidae*, *Hemerobidae*, *Mantispidae*, *Myrmeleonidae*, and *Panorpidae*. By some authors the *Phryganeidae* (the *Trichoptera* of Kirby) are still assigned to *Neuroptera*, though M'Lachlan, Brauer, and others exclude them. The last-named authority has the largest following in restricting the order *Neuroptera* to the four families *Stalidae*, *Hemerobidae*, *Mantispidae*, and *Myrmeleonidae*, forming a separate order *Panorpata* for the family *Panorpidae*, and leaving the *Trichoptera* out as a separate order. In this restricted sense the technical characters of the *Neuroptera* are—wings four in number and reticulate; labial palpi three jointed, the joints free; mandibles free; pupæ distinctly mandibulate; and larvae as in *Myrmeleon*. These insects are all carnivorous in the larval state, and are either aquatic or terrestrial, the aquatic forms pupating terrestrially. See cuts under *Chrysopa*, *Mantis*, and *nerve*.

Neuropteris (nū-rōp'tēr-is), *n.* [NL., *<* Gr. *νεῦρον*, nerve, + *πτερίς*, fern.] A genus of fossil ferns, established by Brongniart in 1828, very widely distributed, especially characteristic of the coal-measures (of Carboniferous age) in different parts of the world, and not passing above the Permian. The fronds are simple, bipinnate or tripinnate, the pinnules rounded, heart-shaped, or articulated at the base, the median nerve sometimes almost entirely wanting, and generally disappearing altogether before the point of the pinnule is reached—theervation diverging from the base or from the middle nerve, fan-like and curving backward. In several species the main stem bears rounded or kidney-shaped leaflets, which were formerly referred to a distinct genus (*Cyclopteris*). The fructification of *Neuropteris* has not yet been clearly made out. 1. The state of being neutral or of being unengaged in a dispute or contest between others; the taking of no part on either side; in *international law*, the attitude and condition of a nation or state which does not take part directly or indirectly in a war between other states, but maintains relations of amity with all the contending parties. It is not a departure from neutrality to furnish to either of the contending parties supplies which do not fall within the description of contraband of war—that is, arms and munitions of war, and things out of which munitions of war are made.

Purchase but their *neutrality*, thy sword Will, in despite of oracles, reduce The rest of Greece. *Gloer, Athenaid, ix.*

S. hist.*, the proclamation by which Washington, in 1793, announced the neutrality of the United States in the war then begun between Great Britain and France.—*Syn. 1. Neutrality, indifference*. A nation may be very far from viewing or regarding with *indifference* a war between two of its neighbors, and yet it may preserve a strict *neutrality*—that is, it may refrain strictly from helping the one that it wishes to see victorious or hindering the one that it wishes to see defeated.

A state may stipulate to observe perpetual *neutrality* towards some or all of its surrounding neighbors, on condition of having its own *neutrality* respected.

neutralization (nū'tral-i-zā'shon), *n.* [= *F. neutralisation*; as *neutralize + -ation*.] *I.* The act of neutralizing; specifically, in *chem.*, the process by which an acid and a base are so combined that the resulting compound has neither acid nor basic properties.

Thus, if a solution of sodium hydrate is carefully added to sulphuric acid, the acidity of the mixture grows less and at length quite disappears, leaving the mixture with neither acid nor basic properties. This is the *neutralization point*. If more sodium hydrate is added, it imparts a basic or alkaline property to the mixture. *Neutralization* can then be brought about only by addition of an acid. In these cases the acid and base are said to *neutralize* each other. The name *neutralization* is also given to the decomposition of alkaline carbonates by the addition of some stronger acid in quantity just sufficient wholly to displace carbonic acid.

There are some cases in which the *neutralization* is effected by the addition of a substance which, even if added in excess, produces a precipitate, and so leaves the solution neutral, so that the addition of an excess of the precipitant is without much importance.
Leo, Photography, p. 425.

2. (a) An act of one or more nations imposing upon one of their number or upon another state a condition of permanent neutrality by ordaining that it shall not take part in any war into which the others may enter, in consideration for which its freedom from attack is usually guaranteed, as in the case of Switzerland in 1815, and Belgium since its separation from the Netherlands in 1830. (b) An act of military powers agreeing that certain persons, property, and places, such as surgeons, chaplains, and the wounded, medical supplies, hospitals, and ambulances, shall be deemed neutral in war, and not subject to capture, etc., as was agreed by the Geneva Convention, 1864. (c) More loosely, the act of securing by convention immunity

In this connection *new* is opposed to *old*; *novel* to *familiar*; *modern* to *ancient*, *medieval*, *antiquated*, *old-fashioned*; *fresh* to *stale*; *recent* and *late* to *early*. *New* is the general word; that which is *novel* is unexpected, strange, striking, often in new form, but also pleasing; as, a *novel* combination of old ideas; that which is *modern* and *fresh* exists at the time referred to; that which is *recent* or *late* is separated from the time of action by only a short interval: as, the *late* ministry, a *recent* arrival, *recent* times.

[*Nicc* in this sense is very common in colloquial use as a

 pleases.] — **To make nice off**. See *makel*. — **Syn. 3.** *Nicc*,
Dainty, *Fastidious*, *Squeamish*, finical, delicate, exquisite,
 effeminate, fussy. *Nicc* is the most general of the first four
 words; it suggests careful choice: as, he is *nicc* in his lan-
 guage and in his dress; it is rarely used of overwrought
 delicacy. *Dainty* is stronger than *nicc*, and ranges from
 a commendable particularity to fastidiousness: as, to be
dainty in one's choice of clothes or company; a *dainty* vir-
 tue. *Fastidious* almost always means a somewhat proud
 or haughty particularity; a *fastidious* person is hard to
 please, because he objects to minute points or to some
 point in almost everything. *Squeamish* is founded upon
 the notion of feeling nausea; hence it means fastidious
 to an extreme, absurdly particular. — 4. Definite, rigorous,

Nicene (nī'sēu), *a.* [*< LL. Nicenus*, less correct-
 ly *Nicenus*, of Nicæa or Nicæ (Nicæna *files*, the
 Nicene Creed), *< Nicæa*, also *Nicæa*, *< Gr. Nikaia*
 (> *Nikaïos*, adj.), a name of several cities (see
 def.), *< Nikaïos*, victorious, *< nikē*, victory.] Of or
 pertaining to Nicæa or Nicæ, a town of Bithy-
 nia, Asia Minor. — **Nicene council**, either of two gen-
 eral councils which met at Nicæa. The first Nicene coun-
 cil, which was also the first general council, met in A. D.
 325, condemned Arianism, and promulgated the Nicene
 Creed in its earlier form. The second Nicene council,
 accounted also the seventh general council, was held in
 787, and condemned the Iconoclasts. The recognition of
 the first Nicene council as ecumenical has been almost uni-
 versal among Christians of all confessions; it is acknowl-
 edged to the present day not only by the Roman Catholic
 and the Greek churches, and by many Protestant churches,
 but by Nestorians, Jacobites, and Copts. The Anglican
 Church does not accept the second Nicene council as ecum-
 enical. — **Nicene Creed or Symbol**, a summary of the
 chief tenets of the Christian faith, first set forth as ecum-
 enical authority by the first Nicene council (A. D. 325),
 but closely similar in wording to ancient creeds of Oriental
 churches, and especially founded upon the baptismal creed

of the church of Cæsarea in Palestine. The distinctive word
 added at Nicæ to indicate the possibility of an Arian con-
 struction was *homoousion* (cousubstantial), which word,
 however, was already in well-established theological use.
 This creed ended with the words *and in the Holy Ghost*, and
 an anathema against the distinctive tenets of the Arians
 was subjoined to it. The second general council — that is,
 the first Constantinopolitan (A. D. 381) — reaffirmed this
 creed, and also authorized, as subsidiary to it, an explana-
 tory version previously formulated, probably in a local
 synod at Antioch, and closely similar to the baptismal creed
 of the church of Jerusalem, differing from the Nicene form
 very slightly in wording, but adding a fuller statement as to
 the Holy Ghost, directed against the heresy of the Macedo-
 nians, and concluding as in the form still used. At the Chal-
 cedonian (or fourth general) council (A. D. 451), the second
 form was authorized equally with the first as the Nicene
 faith, and was officially and historically known from that
 time forward as the *Nicene Creed*; church historians, how-
 ever, sometimes speak of it as the *Niceno-Constantinopol-
 itan Creed*. Both these forms have been reaffirmed ever
 since by all councils claiming to be ecumenical. The sec-
 ond form came into general use in the Eastern Church in
 the latter part of the fifth century, and has remained unal-
 tered in that church to the present day. It remained un-
 altered in the West also for some centuries, but an impor-
 tant addition, namely, the word *filioque*, 'and (from) the
 Son,' after the words *who proceedeth from the Father*, in the
 last paragraph, was introduced in the sixth century, and,
 though still rejected by the Roman Church in the ninth
 century, had by the eleventh become accepted throughout
 all western Europe. It is this form, with the interpolated
filioque, which is used by the Roman Church, the Anglican
 Church, and all Protestant churches which accept the Ni-
 cene Creed, and it is this last form, therefore, which is gen-
 erally called by that name. The Western forms begin "I
 believe," not "We believe," as in the Greek. The Nicene
 Creed in its second form is the only authoritative creed of
 the Eastern Church.

sical architecture sometimes also square in plan. They
 were ornamented with pillars, architraves, and consoles,
 and in other ways. In the architecture of the middle ages
 niches were extensively used in decoration and for the re-
 ception of statues. In the Romanesque style they were so
 shallow as to be little more than panels, and the figures
 were frequently carved on the back in high relief. In the
 Pointed style they became more deeply recessed, and were
 highly enriched with elaborate canopies, and often much
 accessory ornament. In plan they are most frequently
 a semi-octagon or a semi-hexagon, and their heads are
 formed of groined vaulting, with bosses and pendants ac-
 cording to the prevalent architecture of the time. They are
 often projected on corbels, and adorned with pillars, but-
 tresses, and various moldings. Compare cut under *gallery*.

G. nickel = Dan. nikkel = F. nickel = Russ. nikkel' = NL. nicolum, < Sw. nickel, nickel, so called by Cronstedt in 1754, abbr. from Sw. kopparnickel (G. kupfernickel), a mineral containing the metal, < koppar (= E. copper) + *nickel, a word identified by some with G. Nickel, the devil (see Nick⁴) (cf. cobalt as related to kobold), and by others compared with Icel. himkill (Baldorson), a ball, lump.] I. n. 1. Chemical symbol, Ni; atomic weight, 58. A metal closely related to cobalt, with which it almost always occurs. The two are, in fact, so much alike that their chemical separation is by no means an easy task. The specific gravity of nickel is given at 8.357 when cast, and 8.729 if rolled; in this and in atomic weight it differs little from cobalt. Nickel and

cobalt are also closely allied to iron, which they resemble in color, although slightly whiter than that metal, the former having rather a yellowish tinge, the latter a bluish. They are both magnetic, but in a less degree than iron. Both also stand on a par with that metal in regard to most of those qualities which make it valuable in the arts, namely tenacity, malleability, and ductility, but both are so much scarcer than iron that there is no possibility of their replacing that metal to any considerable extent. The occurrence of nickel (as also of cobalt) in connection with iron in meteorites is interesting and peculiar. (See meteorite.) The native metal of terrestrial origin has been found in only one locality, Fraser river, where it occurs in small flattened grains among the scales of gold. The ores of nickel are somewhat widely disseminated, but nowhere occur in great abundance. The arseniuret (kupfernickel) and the silicate are the principal sources of this metal, the latter having been found within a few years in considerable quantity in New Caledonia, where it is exceptionally free from cobalt. Nickel was discovered by Cronstedt in 1751; but it is only within a few years that it has begun to be of considerable commercial importance. Its value has varied greatly since it came into general use. It is an ingredient of certain valuable alloys and especially of German silver, and is now much experimented with in this direction. It is largely used for plating iron in order to improve its appearance and preserve it from rusting. It is also somewhat extensively employed in coinage, in the United States, Belgium, Switzerland, Germany, and Mexico. Nickel bromide has been used in medicine as an antispasmodic, and the chlorid and sulphate as tonics.

It flies chiefly toward evening and in cloudy weather, and belongs to the same family (*Caprimulgidae*) as the whippoorwill and chuck-will's-widow, though it is of a different genus. It is 9 to 10 inches long, 23 in extent of wings, of a slim form, with very small bill but widely cleft and capacious mouth, long, sharp, thin-bladed wings, forked tail, and small weak feet; the plumage is intimately blended with black, brown, gray, and tawny shades, something like dark-veined marble, and the male has a pure white V-shaped mark on the throat, and large white blotches on the wings and tail, which are tawny in the female. It abounds in temperate North America, and is a bird of powerful flight, often seen careering in pursuit of insects, twisting and doubling with great ease and grace, and frequently falling through the air with a hoarse cry. It lays two eggs of elliptical form and dark variegated

color, placing them on the ground with little or no nest. The bird is migratory, and retires beyond the United States in the autumn. There are several other species of the same genus, as *C. henryi* and *C. texensis*.

etc. The bird is 2 feet long and 41 inches in extent of wings; the crown and middle of the back are glossy blackish-green, and most other parts are bluish-gray with a lilac or lavender tinge, the forehead, throat-line, and under parts being whitish. Two or three very long white filamentous feathers spring from the back of the head; the eyes are red, the bill is black, and the lores and legs are greenish. The sexes are alike. The young are very different, being some shade of dingy brown or chocolate-brown, boldly spotted with white. Night-herons nest in heronries, sometimes of vast extent; they build a bulky frail nest of twigs, and lay 3 or 4 eggs of a pale-green color, 2 inches long by 1½ in breadth. The common night-heron of the United States is not specifically distinct from the foregoing; it is popularly called *gull-bird* and *squawk*, from its cry. The night-herons of the genus *Nycticorax* are quite different. *N. violaceus* is the yellow-crowned night-heron, common in the southern United States.

A small sylvine bird of Europe, Asia, and Africa, belonging to the order *Passeres*, the suborder *Oscines*, the family *Sylviidae*, and the genus *Daulias*. There are two kinds, formerly regarded as specifically identical, and variously called by ornithologists *Motacilla* or *Sylvia* or *Philomela* or *Luscinia* *lusciniæ* or *philomela*, and by other New Latin names. The two kinds are most commonly distinguished as *Daulias lusciniæ* or *D. vera*, the true nightingale, and *D. philomela*. The former is the one which is common in Great Britain, and to which the name *nightingale* specially pertains. The poets call both birds *philomel* or *Philomela*. The famous song of the nightingale, heard chiefly at night, is the love-song of the male, which ceases as soon as his propensities are gratified, as is usual with birds. The nightingale is migratory, like nearly all insectivorous birds of the northern hemisphere, extending its migrations far to the north of Europe in the spring. In England, where it appears

about the middle of April and passes the summer, it is quite locally distributed, being very common in some places, and rare or absent from others apparently equally suited to its habits. It haunts woods, copses, and hedgerows, especially where the soil is rich and moist, and is so

secretive as to be oftener heard than seen. The favorite food of the nightingale is the larvæ of insects, especially the hymenoptera, as wasps and ants. The nest is placed on the ground or near it; the eggs are 4 or 5 in number, pale olive-brown, about ¼ inch long by a little over ¼ inch broad. The length of the bird is 6½ inches; its extent of wings is 10½ inches. The sexes are alike reddish-brown above, below pale grayish-brown, whitening on the throat and belly, the tail being brownish-red. This nightingale is sometimes specified as the *brake-nightingale*, when the other species (*D. philomela*) is called *thrush-nightingale*.

This sotted preest, who was gladder than he?
Was never bird gladder agayn the day,
No *nyghtingale* in the season of May,
Nas never noon that iuste bet to singe.

Chaucer, Canon's Yeoman's Tale, l. 332.

4. (*a*) Originally, a social (not a political) movement in Russia, in opposition to the customary forms of matrimony, the parental authority, and the tyranny of custom. In this sense the word was introduced by Turgeneff in 1862. See *nihilist*, 3. (*b*) Later, a more or less organized secret effort on the part of a large body of malecontents to overturn the established order of things, both social and political. Nihilism comprises several Russian parties, differing in the means of action employed and in the immediate results aimed at, some leaning more toward political radicalism and violence, and others toward economic reorganization and socialism. The movement originated about 1840, and is due largely to the influence of the universities. About 1855-62 it became increasingly democratic, socialistic, and revolutionary under the leadership of Herzen and the magazine "Contemporary." About 1870 revolutionary ideas became the subject of a propaganda among workmen, peasants, and students. The adherents of this movement formed a "people's party" ("Land and Freedom"), purposing the complete overthrow of the existing order of things and the establishment of a socialistic and democratic order in its stead. Under the influence of Bakunin (died 1876) and the persecution of peaceful propagandists by the government, the people's party divided into two factions, the "democratization of land" and the "will of the people," the latter being the stronger. This party was by government persecutions driven to a political contest, and the idea of demoralizing the forces of the government by terror originated and became popular; the adherents of this system called themselves "terrorists." After several unsuccessful attempts they effected the death of the Czar Alexander II. in 1881.

Tolstoi, *My Religion* (trans.), Int.

2. One who rejects all the positive beliefs upon which existing society and governments are founded; one who demands the abolition of the existing social and political order of things.

"A *nihilist*," said Nicholas Petrovitch, . . . "signifies a man who . . . recognizes nothing?" "Or rather who respects nothing," said Paul Petrovitch. . . "A man who looks at everything from a critical point of view," said Areadi. "Does not that come to the same thing?" asked his uncle. "No, not at all; a *nihilist* is a man who bows before no authority, who accepts no principle without examination, no matter what credit the principle has."

Turgeneff, *Fathers and Sons* (tr. by Schuyler), v.

Specifically—3. An adherent of nihilism; a member of a Russian secret society which aims at the overthrow of the existing order of things, social, political, and religious; a Russian anarchist or revolutionary reformer. See *nihilism*, 4.

The word *Nihilist* was introduced in Russia by Turgeneff, who used it in his novel "Fathers and Children" to describe a certain type of character . . . which he contrasted sharply and effectively with the prevailing types in the generation which was passing from the stage. The word . . . was soon caught up by the conservatives and

by the Government, and was applied indiscriminately by them, as an opprobrious and discrediting nickname, to all persons who were not satisfied with the existing order of things, and who sought, by any active method whatever, to bring about changes in Russian social and political organization. *The Century*, XXXV. 51.
